BUYING DIPS & BOTTOMS

Before you rush to buy a stock that's down 15-20% after earnings, understand one important rule: The 3-Day Rule!

Oct 28, 2026 · 7:56 PM MST · https://x.com/Venu_7_/status/2115638855869296798 · 🧵 thread

106,194 impressions **1,344** likes **1,335** bookmarks **172** reposts **49** replies

Before you rush to buy a stock that's down 15-20% after earnings, understand one important rule: The 3-Day Rule!

What is the 3-Day Rule, and why does it matter? Let me explain.

When a stock gaps down sharply after earnings or bad news, wait at least 3 trading days before considering buying.

Why? Large institutions managing millions of shares may need several sessions to reduce their positions. The initial gap down might be just the beginning of the selling pressure.

Day 1: An initial bounce could be driven by short covering and aggressive dip buyers rather than sustained institutional demand.

Days 2 and 3: Selling pressure may continue, and the stock could make new lows as investors reassess the news.

After Day 3: Look for signs that selling pressure is fading and price is beginning to stabilize.

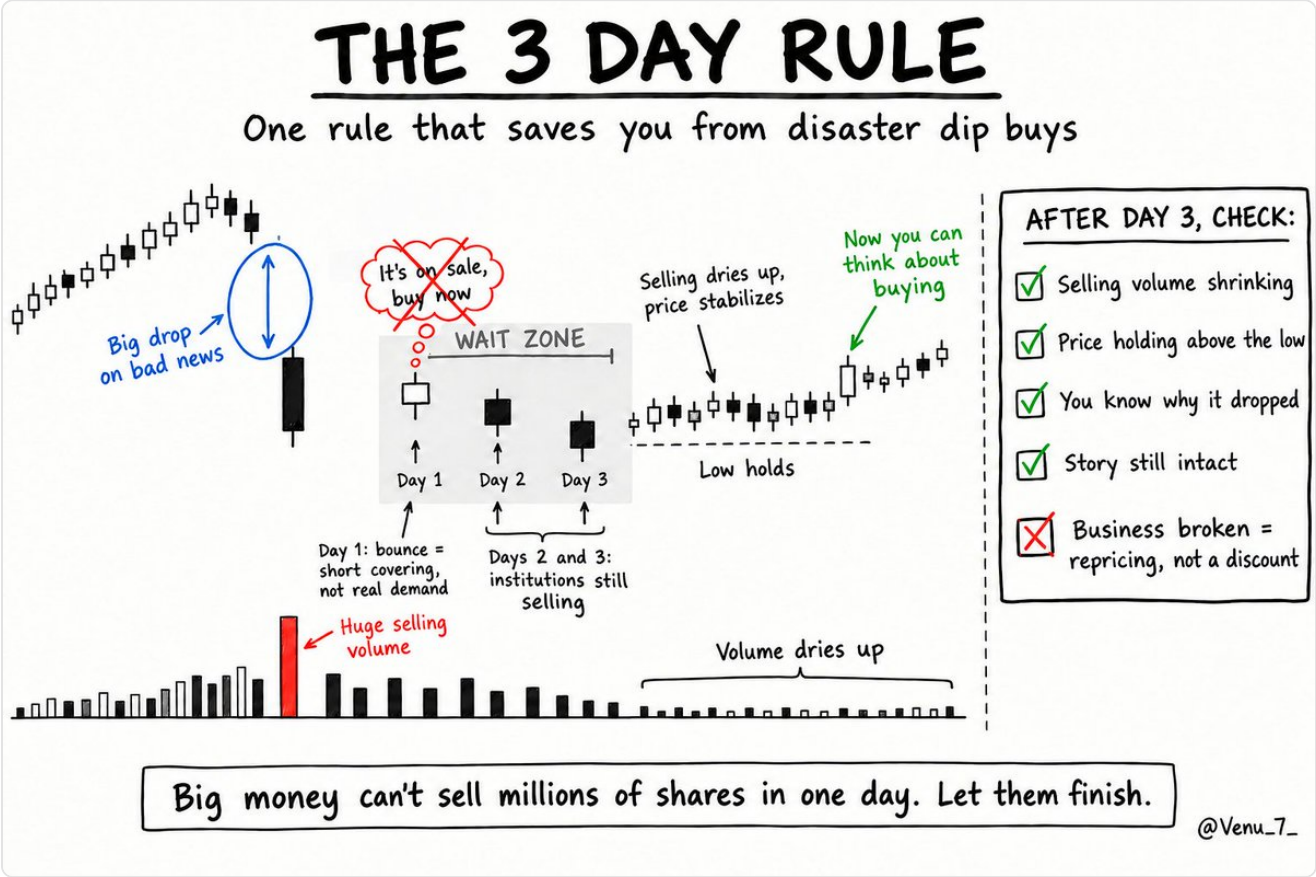

Before buying, check:
- Selling volume is shrinking
- Price is holding above the recent low
- You understand why the stock dropped
- The fundamental thesis remains intact

Remember, three days don't guarantee a bottom. Some stocks need several weeks or even months to build a proper base before beginning another sustained uptrend.

If the business is fundamentally broken, the stock isn't necessarily on sale. It may simply be getting repriced.

The market doesn't reward you for catching the exact bottom. Let the selling pressure fade, let the stock build a base, and let the trend confirm itself.

Missing the bottom is far better than getting caught in a downtrend

BUYING DIPS & BOTTOMS

When to buy the dip? Buy dips in uptrends. Avoid them in downtrends.

Oct 27, 2026 · 6:59 AM MST · https://x.com/Venu_7_/status/2115080995250610676

29,846 impressions **384** likes **361** bookmarks **50** reposts **24** replies

When to buy the dip?

Buy dips in uptrends. Avoid them in downtrends.

In a Stage 2 uptrend, price makes higher highs and higher lows above a rising 200-day SMA. Pullbacks on lighter volume toward rising moving averages often attract buyers, as those averages can act as support.

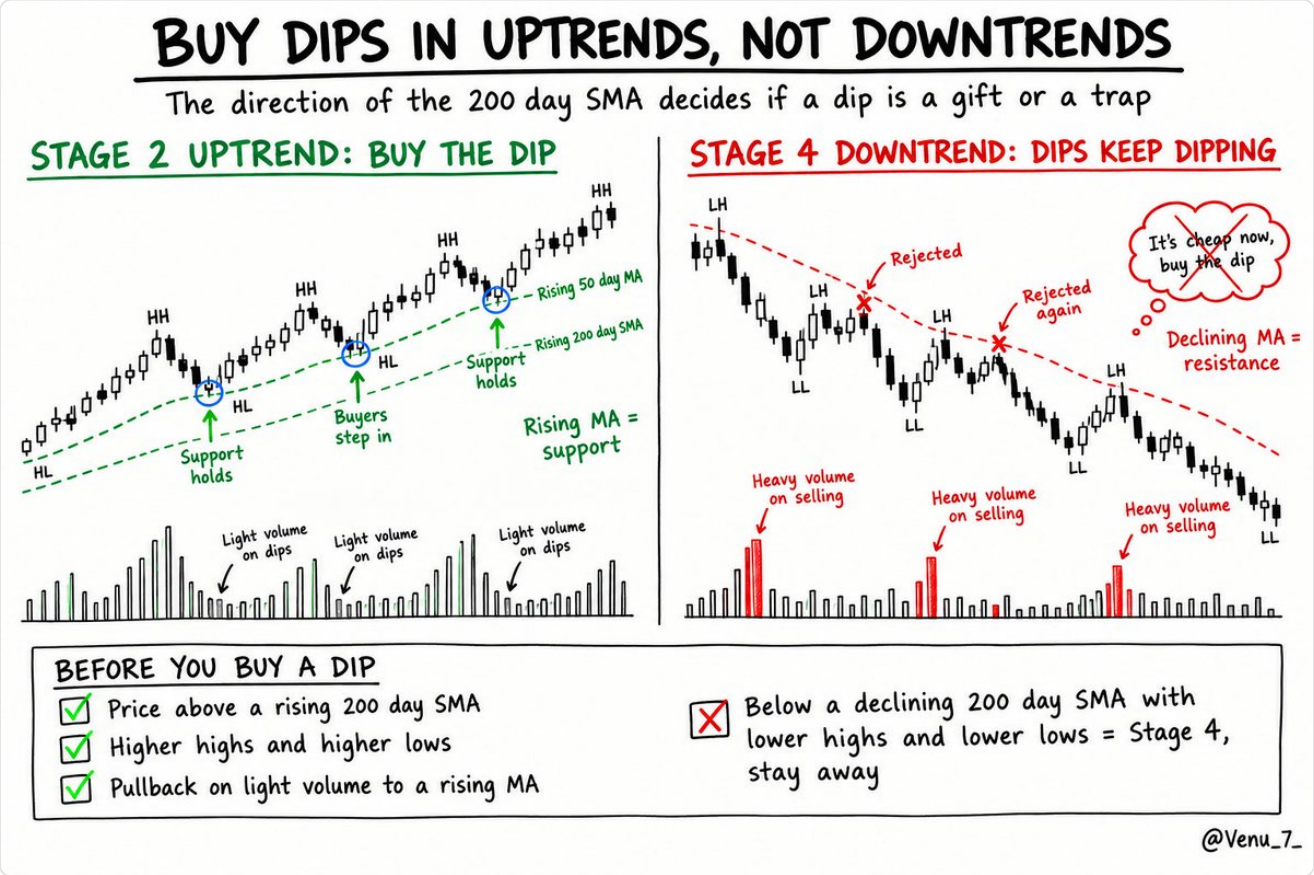

In a Stage 4 downtrend, the opposite happens. Price makes lower highs and lower lows, while rallies toward declining moving averages often face selling pressure. What once acted as support can become resistance.

A stock trading below a declining 200-day SMA might look cheap, but cheap can always get cheaper.

Before buying a dip, look for:
- Price above a rising 200-day SMA
- Higher highs and higher lows
- Pullbacks on lighter volume toward rising moving averages
- Signs of buyers stepping in at support

The goal isn't to buy a stock simply because it's fallen. It's to buy strength during temporary weakness.

Buy the pullback in an uptrend, not the breakdown in a downtrend.

BUYING DIPS & BOTTOMS

One of the biggest reasons to avoid buying dips in Stage 4 downtrends is simple: You never know where the bottom is!

Oct 25, 2026 · 4:45 PM MST · https://x.com/Venu_7_/status/2114503715315216884

16,377 impressions **150** likes **40** bookmarks **6** reposts **9** replies

One of the biggest reasons to avoid buying dips in Stage 4 downtrends is simple: You never know where the bottom is!

Wait for the selling pressure to fade, the stock to build a constructive Stage 1 base, and signs of accumulation to emerge. That's where opportunities become more attractive.

Remember, some of the biggest opportunities emerge after the dust settles, not in the middle of the chaos!

BUYING DIPS & BOTTOMS

I know semiconductor stocks are having a rough time, similar to what software went through in the first half of 2026....

Oct 22, 2026 · 8:47 AM MST · https://x.com/Venu_7_/status/2113296158693130502

28,900 impressions **238** likes **99** bookmarks **9** reposts **16** replies

I know semiconductor stocks are having a rough time, similar to what software went through in the first half of 2026. Many of us are tempted to buy the dip!

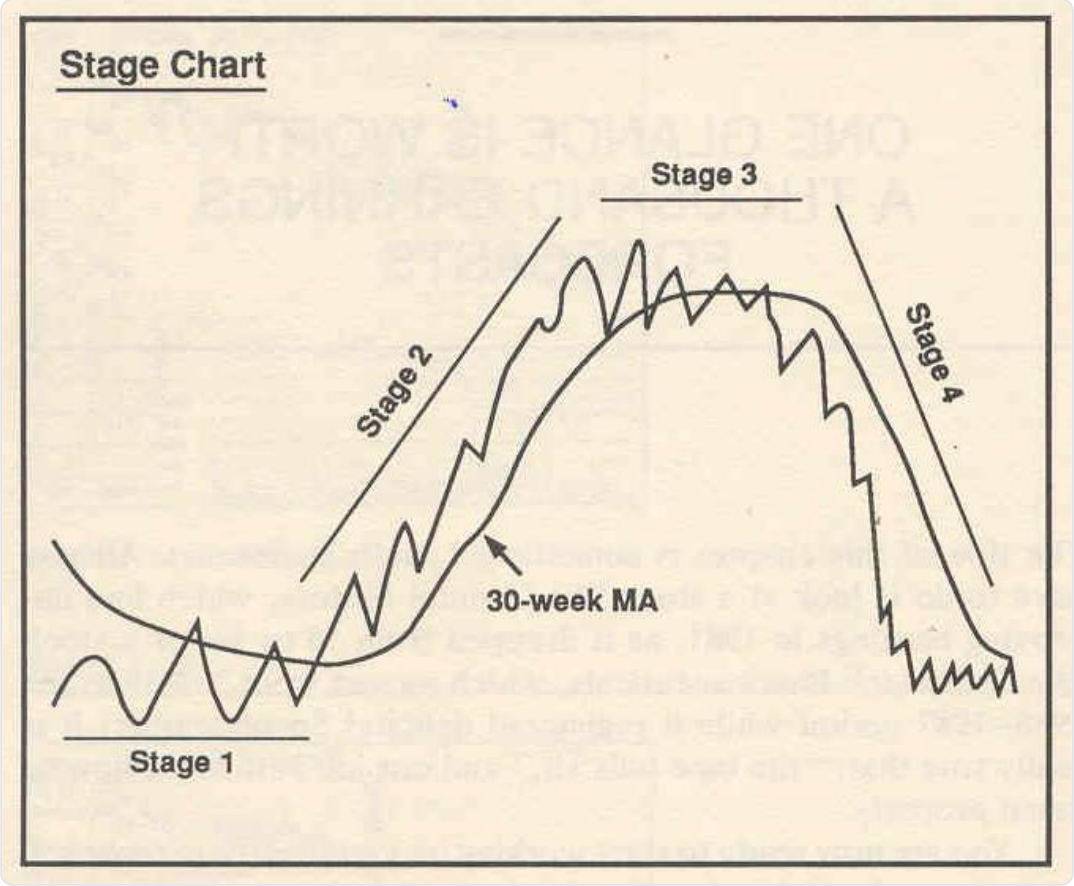

But there's a reason they say, "Don't catch a falling knife!"

Nobody knows where the bottom is. It's better to wait for these stocks to complete their Stage 4 drawdowns, establish Stage 1 bases with sideways price action, and eventually reclaim their 200-day SMAs with improving relative strength.

That's where better risk/reward opportunities could emerge!

I'd rather miss the first 10-15% of a reversal than risk catching a stock halfway through a Stage 4 decline.

Until then, patience and discipline are key. No need to rush into broken charts - Just my two cents!

BUYING DIPS & BOTTOMS

One thing I'm closely watching in the Semi/AI trade is how individual stocks behave following their recent corrections!

Oct 20, 2026 · 1:50 PM MST · https://x.com/Venu_7_/status/2112647706779029995

14,937 impressions **113** likes **49** bookmarks **10** reposts **12** replies

One thing I'm closely watching in the Semi/AI trade is how individual stocks behave following their recent corrections!

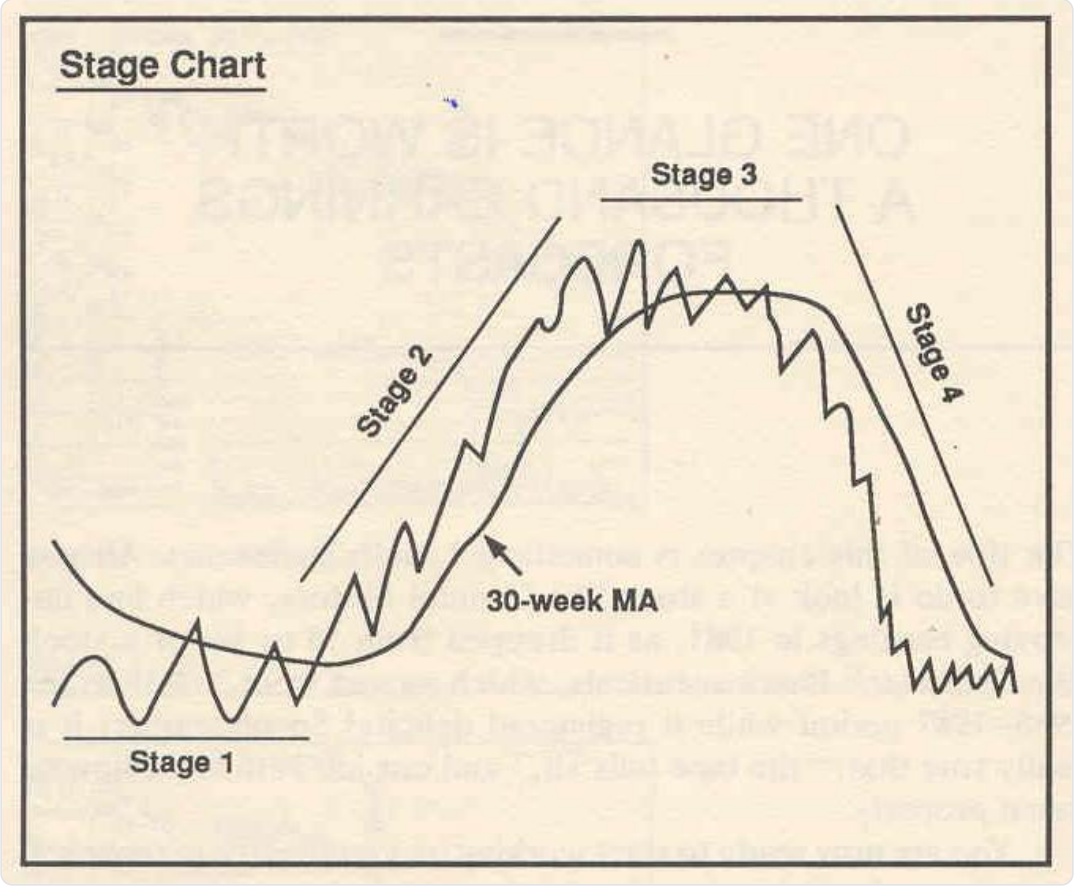

I'd rather let the corrections play out and wait for proper bases to form before looking for new opportunities.

Remember the software selloff in the first half of 2026? Many names went through significant drawdowns, spent months building Stage 1 bases, and only recently started transitioning into Stage 2.

I'm not suggesting semiconductors will follow the exact same path, but it's a good reminder that even the strongest sectors need time to consolidate after massive advances, especially following 1,000%-3,000% moves!

The long-term AI thesis can remain intact while individual stocks go through significant technical corrections.

(Keep the stage analysis chart handy. It will help you better understand these market cycles)

BUYING DIPS & BOTTOMS

Want to know if leading stocks have put in a bottom?

Oct 16, 2026 · 7:21 AM MST · https://x.com/Venu_7_/status/2111100150877966558

14,670 impressions **127** likes **37** bookmarks **3** reposts **13** replies

Want to know if leading stocks have put in a bottom?

Watch whether they hold yesterday's lows!

Several names saw 2x-4x average volume at major support levels, including the 200-day SMA.

The next few sessions are Critical!

Holding those lows, followed by strong buying volume and improving relative strength, would increase the odds of an interim bottom.

One high-volume reversal is encouraging. Sustained accumulation is confirmation!

BUYING DIPS & BOTTOMS

One of the biggest mistakes new investors and traders make:

Aug 6, 2026 · 10:06 AM MST · https://x.com/Venu_7_/status/2085412302531203401

89,416 impressions **1,068** likes **963** bookmarks **133** reposts **67** replies

One of the biggest mistakes new investors and traders make:

Buying a stock that gaps down after earnings.

It looks like a discount. It's usually a trap. To avoid falling into that trap, follow one simple rule:

The 3-Day Rule.

When a stock gaps down on earnings, wait at least 3 trading days before even thinking about buying.

Why?

Institutions holding millions of shares can't exit in one day. The gap down isn't the end of their selling - it's the beginning.

- Day 1: Bounce = dip buyers + short covering, not real demand.
- Days 2-3: You'll see whether the selling pressure actually dries up.
- After Day 3: The stock will tell you if it's stabilizing or still bleeding.

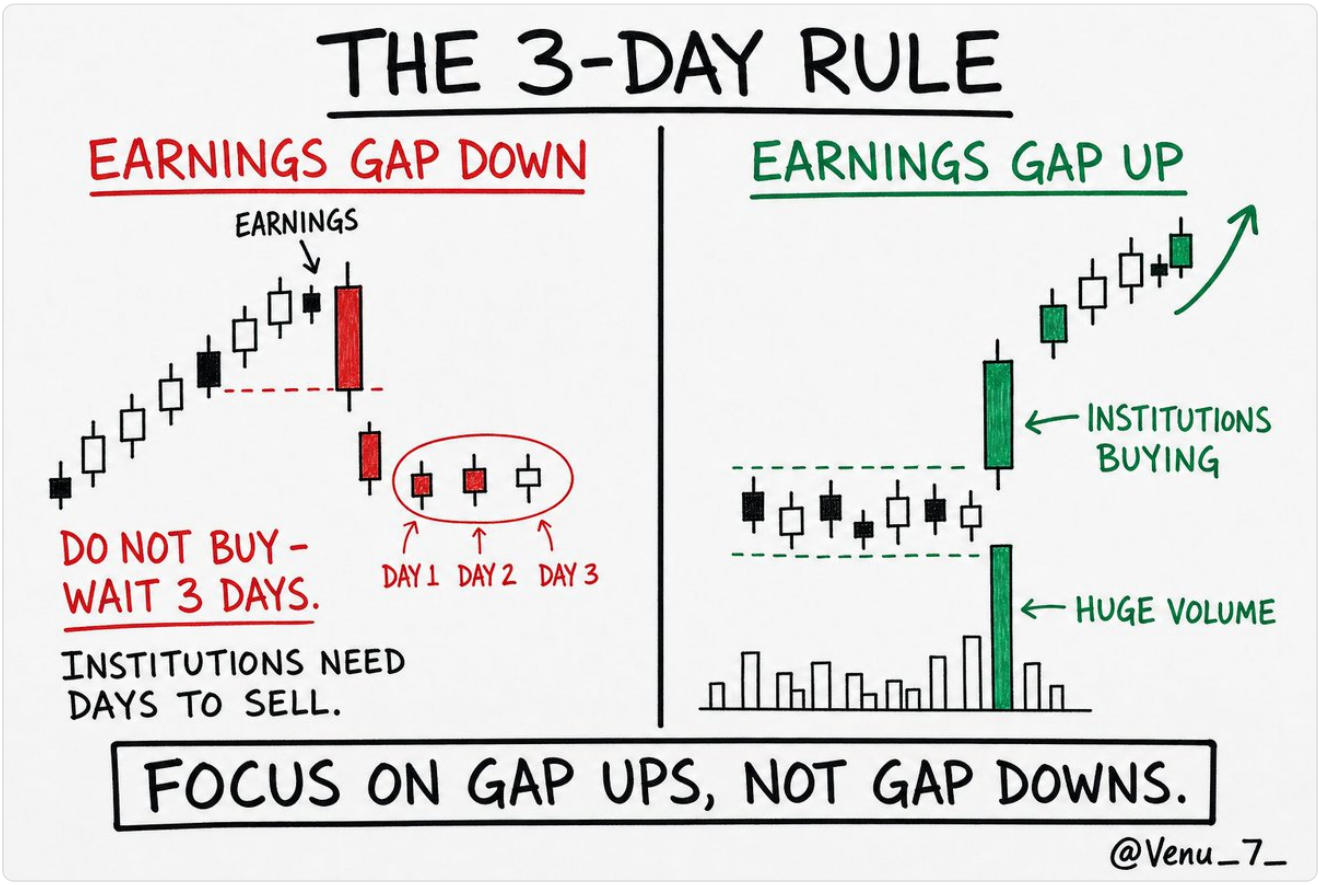

You're trading with evidence, not hope.

And remember:
Our focus should always be on earnings gap ups, not gap downs.

A gap up on heavy volume usually signals institutional buying like **$PLTR** - and their buying often takes days or even weeks to complete. That's the fuel behind many of the market's biggest winners.

Gap down = big money leaving.
Gap up = big money arriving.

Own what they're accumulating. Don't try to catch what they're distributing.

THE 3-DAY RULE
EARNINGS GAP DOWN
EARNINGS
DO NOT BUY -
WAIT 3 DAYS.
DAY 1 DAY 2 DAY 3
INSTITUTIONS NEED
DAYS TO SELL.
EARNINGS GAP UP
INSTITUTIONS
BUYING
HUGE VOLUME
FOCUS ON GAP UPS, NOT GAP DOWNS.

When I posted about the Follow-Through Day, trust me-my entire timeline was bearish. Some were calling for a bear market, while others were comparing it to 2022.

Like I've always said, when opportunities show up, people on X seem to panic.

It's simple math:
Is it better to buy at the top, or buy great companies after a reasonable pullback?

According to Goldman Sachs, individual (retail) investors were among the biggest sellers during this correction, with semiconductors seeing the largest outflows. I'm genuinely sorry to hear that.

Markets will always give you opportunities. The key is to stay patient, avoid leverage, and have the conviction to buy quality businesses when they're on sale - not when everyone is chasing them.

Don't use leverage. Buy great companies at reasonable prices. Let time do the heavy lifting.

Follow-Through Day Watch: Update

Aug 3, 2026 · 8:33 AM MST · https://x.com/Venu_7_/status/2084301624210813002 · 🧵 thread

67,299 impressions **536** likes **385** bookmarks **53** reposts **44** replies

Follow-Through Day Watch: Update

Last week's post is playing out in real time on **$QQQ**.

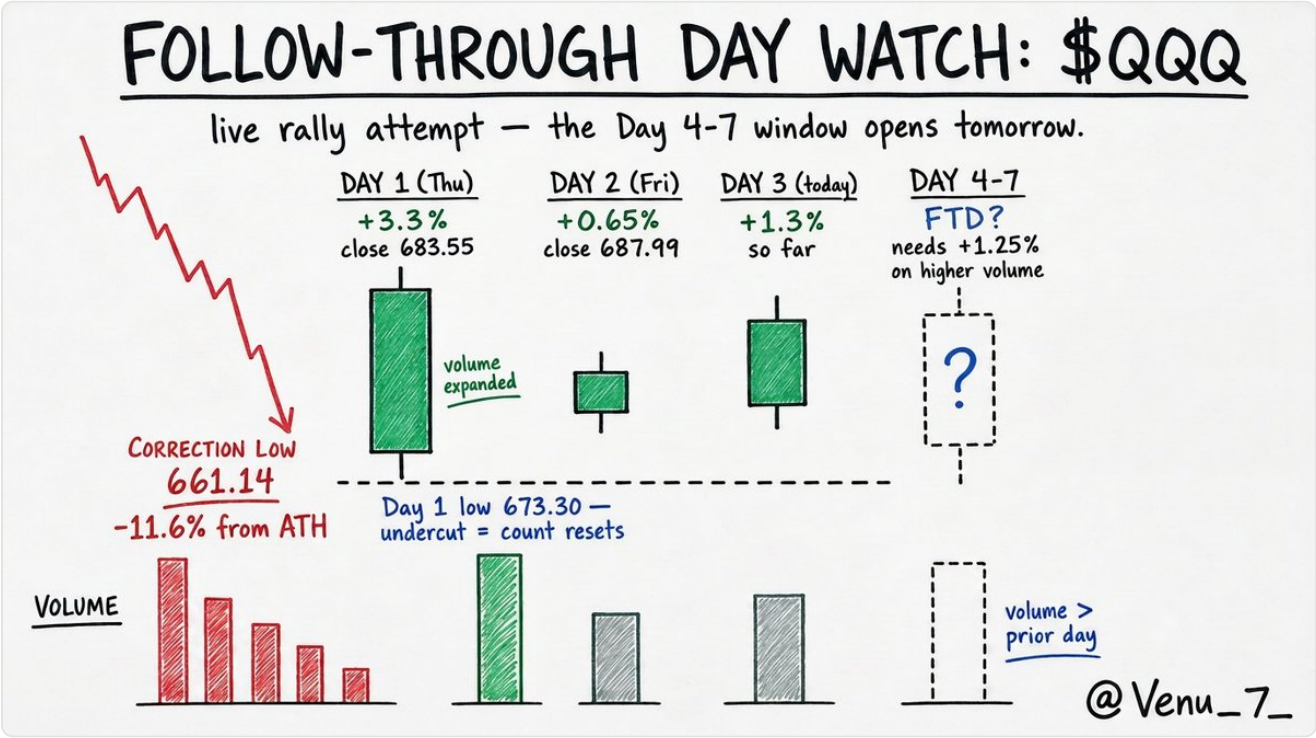

Day 1 (Thu): +3.3% close off the lows. Rally attempt on and volume expanded vs the prior day.
Day 2 (Fri): +0.65%. Day 1 low held.
Day 3 (today): +1.3% and counting.

Tomorrow the FTD window opens. Day 4-7 is where the strongest signals fire.

What we need:
- A +1.25% or bigger daily gain on QQQ or SPX
- Volume higher than the previous day
- Day 1 low (673.30) never undercut - that resets the count

Two things most people get wrong:
- Today's move can't be the FTD, even if it closes big. Day 4 or later - that's the rule.
- No gap-up required. Just price + volume.

If we get it: confirmed uptrend.
If we don't: patience.

Want to Know If the Bottom Is In? Read this.

Since **$QQQ** just printed a gap-up candle, the next thing I'll be watching is the Follow-Through Day (FTD).

One of William O'Neil's most important rules for confirming a market bottom.

How it works:
- Market is in a correction. The first day an index closes higher = Day 1 of a rally attempt.
- Days 2-3 don't need to be up. The rally stays alive as long as Day 1's low holds.
- Then on Day 4-7, watch for one major index (S&P 500 or Nasdaq) to gain 1.25%+ on volume higher than the day before.

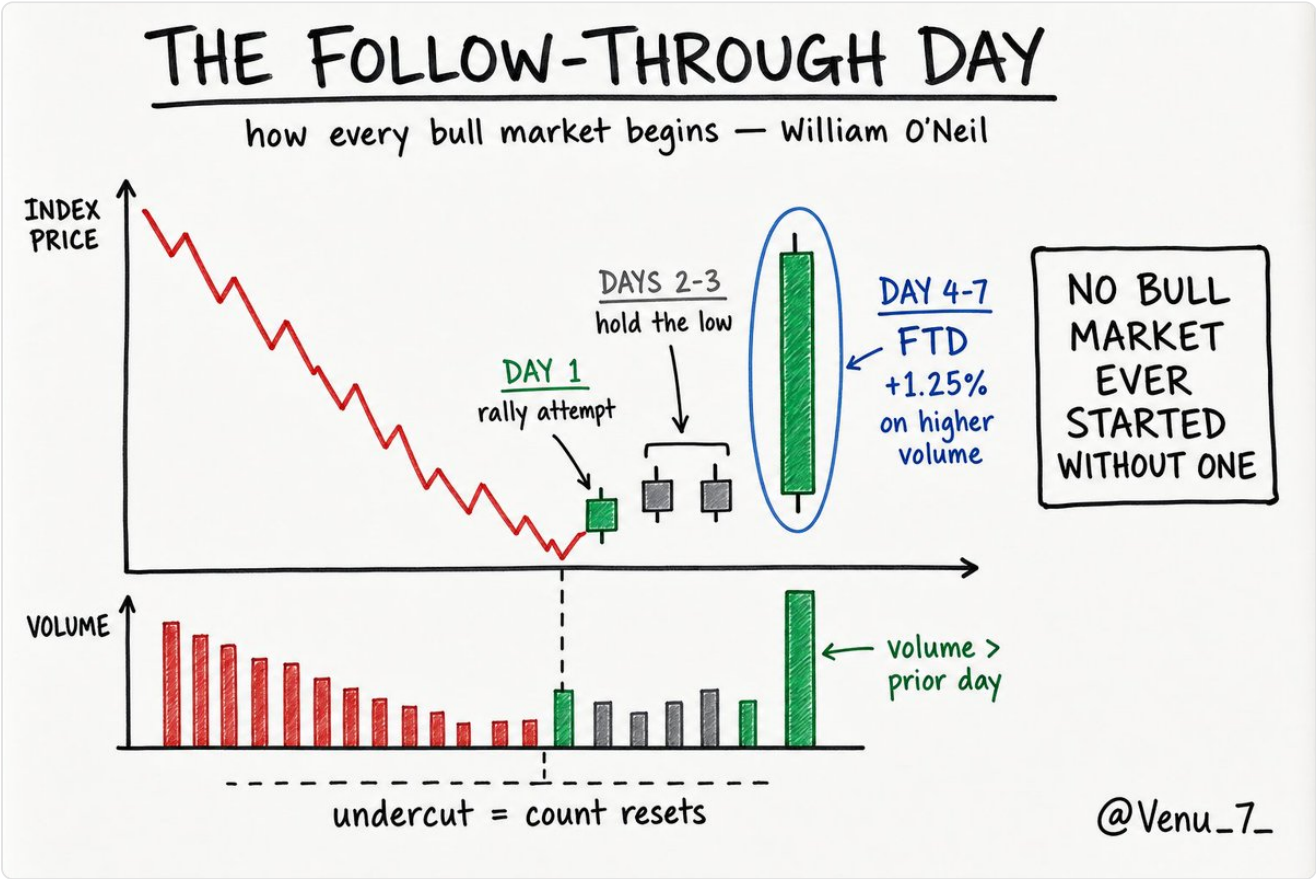

That's the follow-through day. Downtrend over. Confirmed uptrend.

The rules that matter:
- Not every FTD works - many fail
- But no bull market has EVER started without one.
- Undercut Day 1's low -> the count resets
- FTDs after Day 10 carry lower success rates

What to actually do on an FTD:
Don't go all in. Buy starter positions in leading stocks breaking out of sound bases. If the rally is real, they work - and you add. If it fails, you're barely exposed.

O'Neil's whole point: you don't predict bottoms. You confirm them.

Corrections are for building the watchlist. The FTD tells you when to use it.

Thread reply 1/1 · link

During March 2026 Correction, we got the follow through day during on Day 6 for QQQ's!

let's see how it plays out this time!

BUYING DIPS & BOTTOMS

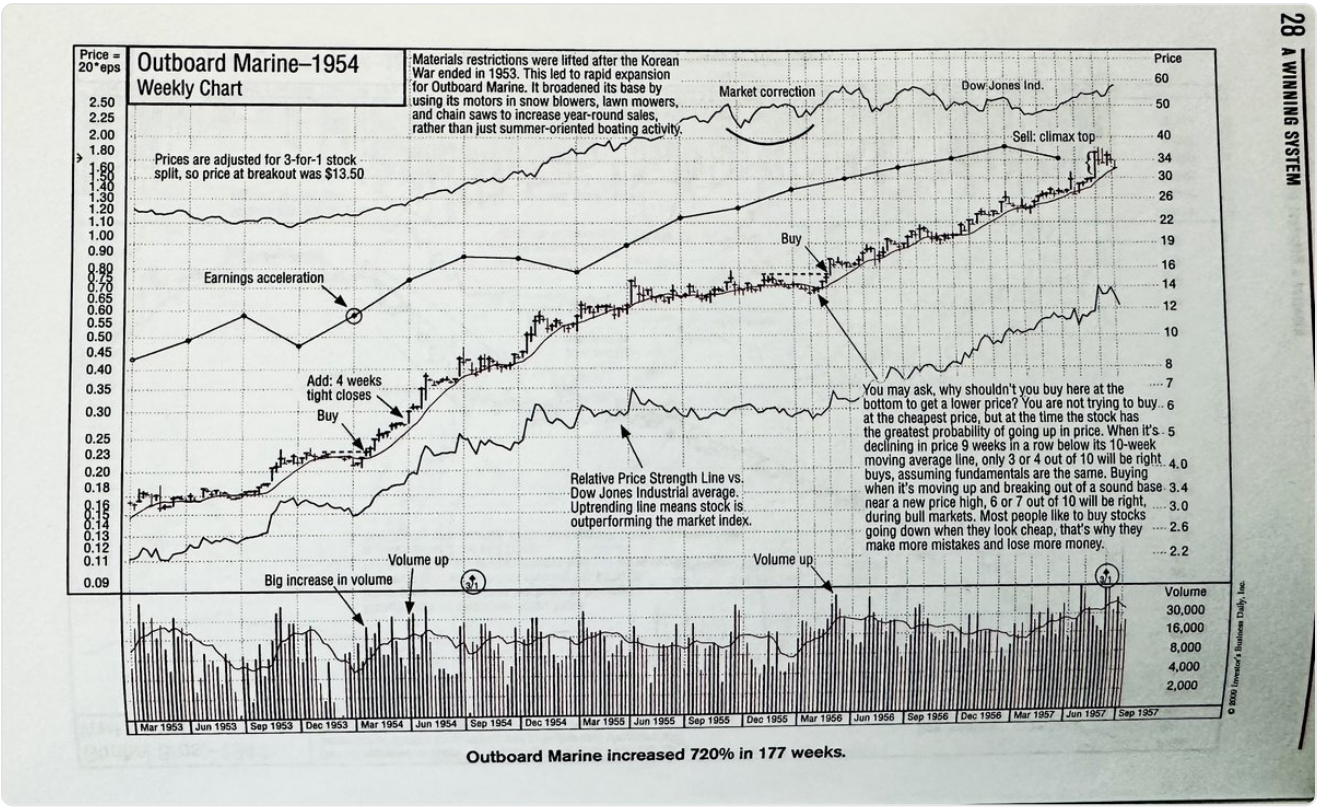

One important point from William O'Neil:

Apr 28, 2026 · 1:38 PM MST · https://x.com/Venu_7_/status/2049226763029688384

18,415 impressions **290** likes **165** bookmarks **25** reposts **15** replies

One important point from William O'Neil:

"You may ask, why shouldn't you buy here at the bottom to get a lower price? You are not trying to buy at the cheapest price, but at the time the stock has the greatest probability of going up in price. When the stock is declining for 9 weeks in a row below its 10-week moving average line, only 3 or 4 out of 10 will be right buys, assuming fundamentals are the same. Buying when it's moving up and breaking out of a sound base near a new price high, 6 or 7 out of 10 will be right, during bull markets. Most people like to buy stocks going down when they look cheap, that's why they make more mistakes and lose more money."

BUYING DIPS & BOTTOMS

One thing I've intentionally avoided during this drawdown is trying to catch falling knives in software and crypto names. Just because a stock is down a lot doesn't mean it's cheap. Stage 4 declines can go much lower and stay there longer than expected.

Give these names time to stabilize, form proper bases, and prove strength before entering.

This is exactly why I urge everyone to rely on technical frameworks like Stan Weinstein's Stage Analysis and William O'Neil's CANSLIM. They help you stay aligned with strength, not weakness.

I stayed focused on semis and energy, where trends remained intact instead of forcing trades in broken areas.

What we're seeing right now is a real transition driven by AI. We don't yet know who the winners and losers will be.

Study what happened to newspaper stocks from 2000 to 2010. Many never recovered after their Stage 4 breakdowns.

Everyone loves buying dips, but timing matters.

$NVO is a good example.

Buying during a downtrend is just guessing - bottoms are rarely caught. After the selloff, strong stocks usually pause, build a base, and let moving averages catch up. That's where the real edge shows up.

Same rule applies everywhere. Let leaders base first. Chasing dips is how most people get chopped up.

Thread reply 1/1 · link

$NFLX is one more example of let stocks form base first

BUYING DIPS & BOTTOMS

$BTSG This is what buying dips in a strong uptrend looks like.

BUYING DIPS & BOTTOMS

My number one advice: never catch a falling knife.

Nov 16, 2025 · 9:53 AM MST · https://x.com/Venu_7_/status/1990101002620633302

41,553 impressions **259** likes **90** bookmarks **16** reposts **13** replies

My number one advice: never catch a falling knife.

After a big drawdown, let the stock base out, let it reconnect with the 200-day SMA, and watch for steady accumulation. That's when real leaders reset and prepare for the next leg higher and that's where our focus should be.

BUYING DIPS & BOTTOMS

- Don’t rush to buy the dip.

Oct 10, 2025 · 3:02 PM MST · https://x.com/Venu_7_/status/1976770415336063096

30,985 impressions **251** likes **116** bookmarks **18** reposts **23** replies

- Don’t rush to buy the dip.
- Let **$SPY** and **$QQQ** reclaim the 21 EMA first.
- Watch which stocks are holding up and add them to your watchlist.
- Make sure you have some exposure to **$TLT**.
- Pay attention to sell volume distribution matters.
- Wait for a blow-off top on the VIX candle.

Patience is the game here.

STAGE ANALYSIS & TREND

Most people lose interest when a stock goes nowhere for months. That's exactly when you should start paying attention!

Oct 28, 2026 · 10:52 AM MST · https://x.com/Venu_7_/status/2115501851806507140

17,976 impressions **258** likes **263** bookmarks **31** reposts **20** replies

Most people lose interest when a stock goes nowhere for months. That's exactly when you should start paying attention!

Let me explain one of the most important concepts in Stage Analysis that has helped me generate strong returns in the stock market: Stage 2 Breakouts!

A Stage 2 breakout is when a stock transitions from a sideways consolidation into a new uptrend.

There are three important things I look for:

1. Stage 1 Base

The stock spends weeks or months consolidating, often after a significant decline.

During this phase, selling pressure gradually fades, volume typically dries up, and the stock begins building a foundation for its next move.

2. The 200-Day SMA Flattens or Turns Higher

As the stock moves above its 200-day SMA and the moving average begins flattening or rising, it's an early indication that the long-term trend may be changing.

3. Breakout With Strong Volume

Price breaks above the base resistance (pivot), ideally on volume 40% or more above average.

This suggests increasing institutional demand and strengthens the breakout.

My Stage 2 Breakout Checklist:
- Price above the 200-day SMA
- 200-day SMA flat to rising
- Clean, well-developed Stage 1 base
- Close above the pivot
- Strong volume on the breakout

Some examples of stocks that transitioned from long Stage 1 bases into Stage 2 uptrends:
$ISRG $SPOT $A $CRM $NOW $RBLX $SHOP $SAIL $ELF $ANF $MSFT $RNG $FROG $TEAM $PLTR $SNOW $WDAY $IGV $FSLY $CART $SWKS $HPQ $LMT $GILD $TEM $XBI $GH $UPS $VSCO $GTLB $ASAN $TEVA

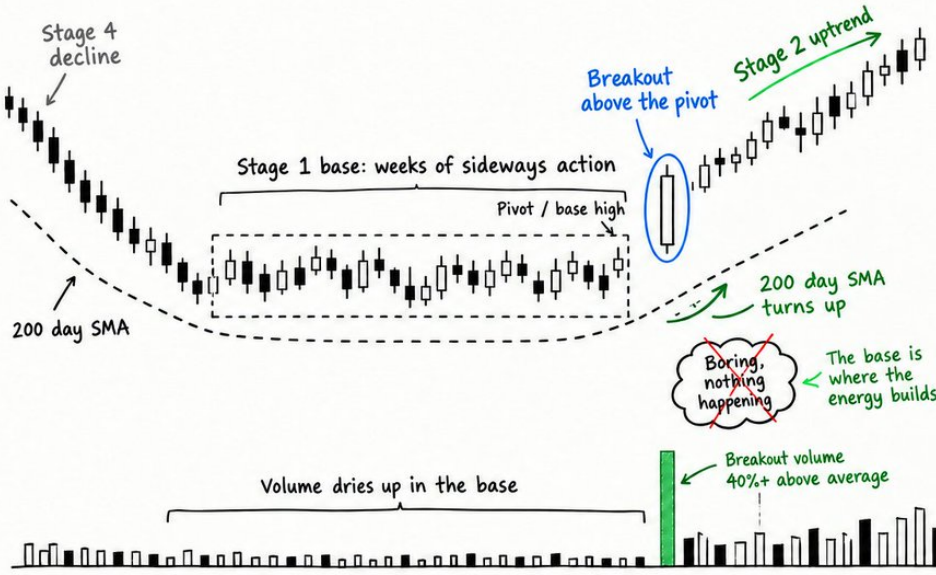

Remember, not every breakout will succeed. Market conditions, sector strength, and relative strength also play important roles.

The most interesting opportunities often emerge when a stock transitions from a long Stage 1 base into an early Stage 2 uptrend.

Stage 1 builds the base. Stage 2 is where the big money can be made!

WHAT IS A STAGE 2 BREAKOUT?

Base + rising 200 day SMA + big volume = the start of a new uptrend

STAGE 2 BREAKOUT CHECKLIST

- ☑ Price above the 200 day SMA
- ☑ 200 day SMA flat to rising
- ☑ Clean base, at least 5 weeks
- ☑ Close above the pivot
- ☑ Big volume on breakout day

Stage 1 builds the base. Stage 2 is where the big money is made.

Want to know how to avoid major drawdowns and improve your returns in the stock market?

Understanding Stan Weinstein's Stage Analysis is a great place to start. Every stock moves through 4 stages!

One of the most important lessons I've learned from Stan Weinstein's Stage Analysis is understanding where a stock stands in its market cycle and when to buy, hold, reduce exposure, or stay away.

The framework primarily uses the 30-week moving average (roughly equivalent to the 150-day SMA), price action, volume, and relative strength.

Stage 1: Basing / Accumulation

What does it look like?
- Usually forms after a prolonged Stage 4 downtrend
- Stock stops making consistent lower lows and starts trading sideways
- 30-week moving average begins to flatten
- Price moves above and below the flattening moving average
- Selling pressure decreases, and volume often dries up

What does it mean?
- The stock is trying to establish a bottom, but buyers haven't taken full control yet. This is where I start building my watchlist and looking for improving technicals, higher lows, and signs of accumulation.

- Remember, a stock falling 50-70% doesn't automatically make it a Stage 1 base. It needs time to stabilize and build a proper structure.

Stage 2: Advancing/Uptrend

What does it look like?
- Stock breaks out above its Stage 1 base
- Breakout ideally happens on expanding volume
- 30-week moving average starts sloping upward
- Higher highs and higher lows
- Relative strength improves against the broader market

What does it mean?
- Buyers are taking control, and institutional accumulation may be supporting the uptrend.

- This is my favorite stage to own growth stocks! I generally look for Stage 1 → Stage 2 breakouts and constructive pullbacks to rising moving averages.
- The goal isn't to buy at the absolute bottom but to participate when the stock starts showing evidence of a sustainable uptrend.

Stage 3 vs. Stage 4 - This is where a lot of us make mistakes!

Stage 3: Topping / Distribution

What does it look like?
- Usually forms after a prolonged Stage 2 advance

- Momentum slows, and price starts moving sideways
- 30-week moving average begins flattening
- Price repeatedly crosses above and below the moving average
- Breakouts start failing, and selling volume may increase
- Major support levels are still holding

What does it mean?
- The previous uptrend is losing momentum, and the stock may be going through distribution.

- Stage 3 doesn't automatically mean a crash is coming. Some stocks consolidate and resume their uptrends.

- For me, this is where I become cautious, tighten risk management, consider trimming positions, and avoid aggressively adding exposure.

Stage 4: Declining / Downtrend

What does it look like?
- Stock breaks below major support or its Stage 3 range
- 30-week moving average starts sloping downward
- Price trades below the declining moving average
- Lower highs and lower lows
- Short-term rallies often fail near declining moving averages

What does it mean?
- Sellers are in control, and the stock is in a downtrend.

- One of the biggest lessons I've learned is that technicals often reveal weakness before fundamentals do.

- A company can continue reporting strong earnings while its stock is entering Stage 4 because the market is already pricing in future expectations.

The biggest difference between Stage 3 and Stage 4:

Stage 3 = Sideways price action, flattening moving averages, potential distribution.
Stage 4 = Support breakdown, declining moving averages, established downtrend.

Another important thing to understand is that Stage 1 and Stage 3 can look very similar!

Both involve sideways price action and flattening moving averages. The difference is what happened before:

- Sideways consolidation after a prolonged decline could be Stage 1.
- Sideways consolidation after a major advance could be Stage 3.

My approach is simple:
Stage 1 - Build your watchlist and prepare.
Stage 2 - Look for opportunities to participate.
Stage 3 - Protect your gains and manage risk.
Stage 4 - Protect your capital and avoid weak downtrends.

Stage Analysis isn't perfect, but it's one of the most valuable frameworks I've learned in my investing and trading journey.

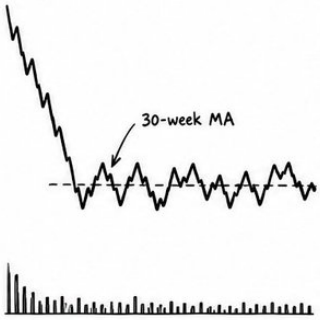

I use technicals to understand WHEN to participate and fundamentals to understand WHAT I'm buying.

Understanding these four stages can make a tremendous difference in how you navigate market cycles!

STAGE ANALYSIS

Every stock moves through 4 stages

STAGE 1: BASING

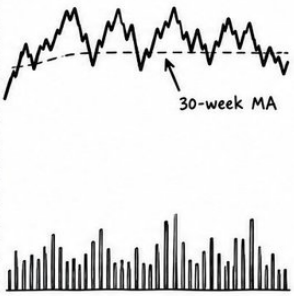

- Flat MA
- Sellers exhausted
- WATCH

STAGE 2: ADVANCING

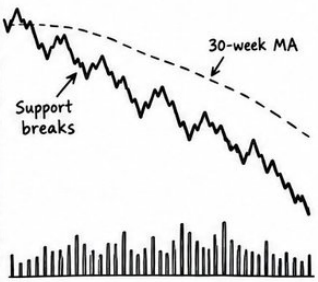

- Rising MA
- Higher lows
- BUY

STAGE 3: TOPPING

- Flat MA
- Heavy down volume
- PROTECT

STAGE 4: DECLINING

- Falling MA
- Lower highs
- AVOID

Stage 3 vs Stage 4

Stage 3 = sideways, supply building.
Stage 4 = support broken, trend down.

The trap

Stage 1 and Stage 3 look alike.
Sideways after a decline = base.
Sideways after a run = potential top.

STAGE ANALYSIS & TREND

Technical Analysis plays a crucial role in how I select stocks!

Oct 21, 2026 · 10:04 AM MST · https://x.com/Venu_7_/status/2112953061228593386

12,957 impressions **143** likes **144** bookmarks **15** reposts **13** replies

Technical Analysis plays a crucial role in how I select stocks!

Two of the biggest influences on my investing/trading approach are Stan Weinstein's Stage Analysis and William O'Neil's CANSLIM framework.

Here's how I apply them:

1. Stage Analysis: Helps me identify where a stock stands in its market cycle.
- Stage 1: Basing and accumulation
- Stage 2: Advancing uptrend
- Stage 3: Topping and distribution
- Stage 4: Declining downtrend

My primary focus is identifying stocks transitioning from Stage 1 into Stage 2, ideally supported by improving relative strength and expanding volume.

2. CANSLIM: Helps me identify companies with strong earnings and revenue growth, institutional sponsorship, industry leadership, and favorable overall market conditions.

3. Anchored VWAP & Moving Averages: I use anchored VWAPs, 9/21 EMAs, and 50/100/200-day moving averages to identify potential entries, support and resistance levels, and changes in trend.

But technicals alone aren't enough!

My overall investing/trading framework:
- Technicals: 50%
- Fundamentals: 30%
- Leadership & Product: 10%
- Common Sense: 10%

The goal isn't to predict every market move or catch every bottom and top. It's to identify high-probability opportunities, manage risk effectively, and stay aligned with the prevailing trend.

One of the most valuable skills you can develop as a trader or investor is the ability to analyze stocks independently, build conviction through your own research, and make decisions without relying on anyone else's opinions.

Master your framework. Trust your process. Stay disciplined!

STAGE ANALYSIS & TREND

One of the Biggest Changes I Made to My Approach to the Market - And How It Helped Me Catch Multibaggers

Sep 22, 2026 · 9:20 AM MST · https://x.com/Venu_7_/status/2102432743196180793

28,935 impressions **490** likes **514** bookmarks **59** reposts **39** replies

One of the Biggest Changes I Made to My Approach to the Market - And How It Helped Me Catch Multibaggers

I used to think I needed to wait for the breakout.

I don't anymore.

Over time, I've learned that I much prefer building my positions inside the base rather than buying regular breakouts or chasing extended ones.

If I get the fundamentals right and the technical structure is developing the way I want, I'm comfortable getting positioned while the base is still forming.

I usually look for:
- A powerful long-term theme
- Accelerating fundamentals
- EPS growth above 30% yoy
- Stage 1 base or consolidation
- Higher lows + signs of accumulation
- Support around key MAs / AVWAPs

This is where fundamentals and technicals work together for me. Fundamentals tell me what I want to own. Technicals tell me when I want to start building it.

By the time the breakout comes, I already want to have a position. I'm not looking at the breakout as my entry anymore - I look at it as confirmation.

Recent examples:
$HOOD around $105
$RBRK around $75

Past winners:
$ARM around $160
$MRVL around $92

I'm not trying to predict the exact bottom of the base. I'm trying to recognize when a great business is building a structure that could eventually lead to its next Stage 2 move.

And position sizing matters.

I don't need to go full size on day one. I can start building inside the base and add as the technicals improve and the thesis continues to play out.

That's one of the biggest advantages I've found from combining fundamentals + technicals.

But getting in early is only half of it.

The other side of this approach is holding my winners much longer.

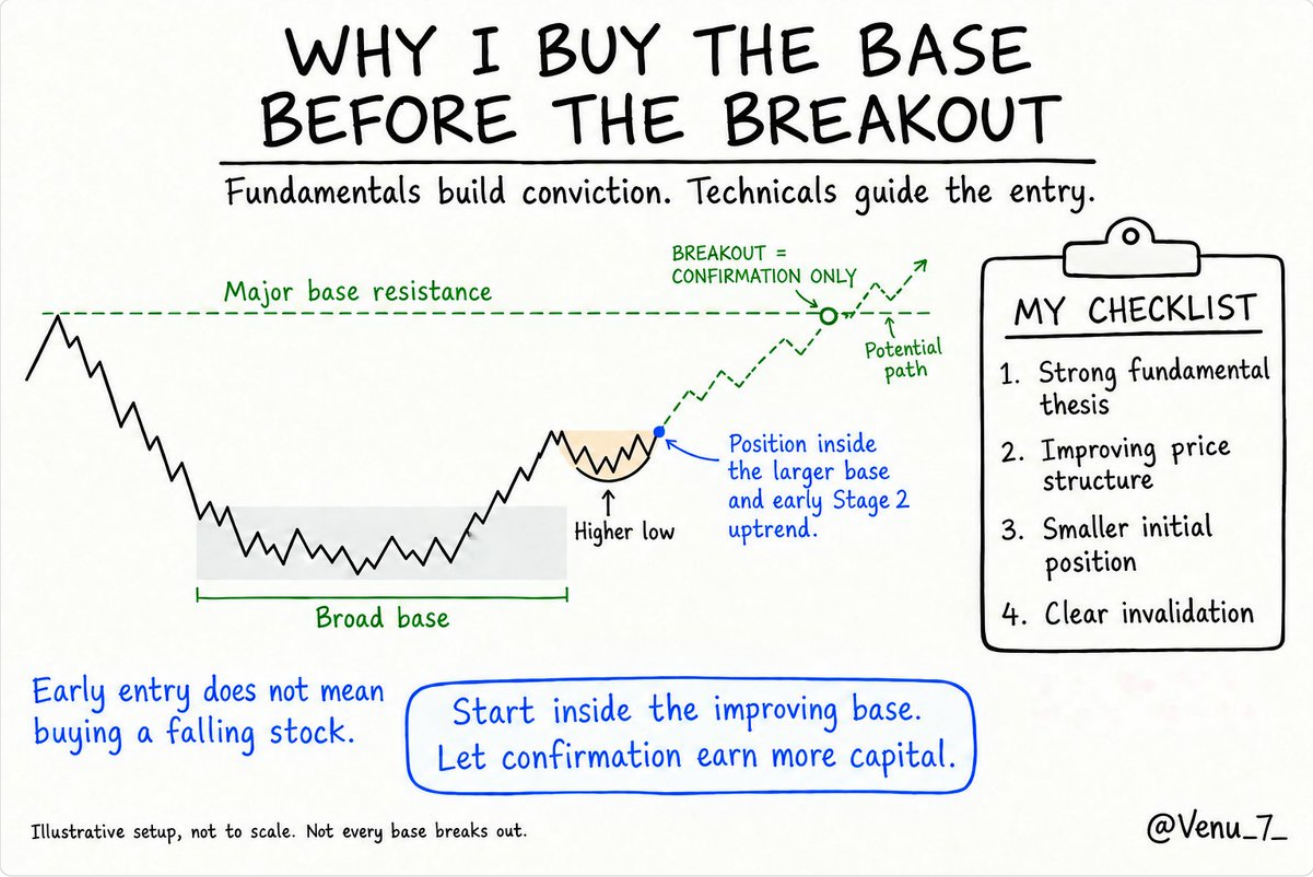

Once a position breaks out and enters a strong Stage 2 trend, I don't want to sell just because I'm up 30%, 50%, or even 100%.

I stay with the trend until something materially changes. And I never make that decision based on a single indicator. It's always a combination of factors - price action, key MAs/AVWAPs, trend structure, distribution, and whether the fundamentals or original thesis have changed. One indicator breaking doesn't automatically mean the trend is over.

Getting positioned inside the base gives me the cost basis.

Staying with the trend gives the position enough time to become a multibagger.

Find them early. Build inside the base. Add on confirmation. Hold while the trend remains intact.

STAGE ANALYSIS & TREND

One of the most important skills you must develop as you grow as an investor or trader is pattern recognition.

Sep 18, 2026 · 9:50 AM MST · https://x.com/Venu_7_/status/2100990849786298741 · 🧵 thread

One of the most important skills you must develop as you grow as an investor or trader is pattern recognition.

And I'm not just talking about recognizing a cup & handle, bull flag or double bottom.

Technical analysis is really the study of human psychology expressed through price and volume. Fear, greed, FOMO, capitulation, accumulation and distribution - all eventually show up on the chart.

Different stocks. Different years. Different narratives. But human behavior doesn't change much.

A breakout on strong volume tells you buyers are becoming more aggressive. A tight consolidation after a massive move tells you there isn't much selling pressure. Heavy distribution tells you institutions may be heading for the exits. A long Stage 1 base can show you that months of selling pressure are slowly being absorbed.

This is why I spend so much time studying historical charts. The more charts you study, the more you start seeing the same behaviors repeat themselves across different stocks and different market cycles.

Eventually, you stop looking at a chart and simply seeing lines and patterns. You start understanding the battle between buyers and sellers behind them.

You're not just memorizing patterns. You're training your brain to recognize human behavior repeating itself in the market.

That's what technical analysis is really about.

> Thread reply 1/1 · link
>
> human psychology plays a huge role in the stock market. The edge is learning to see what others aren't seeing yet.

Want to Know If the Market Is Topping or Just Resetting for the Next Leg Higher? Read this.

Sep 13, 2026 · 9:41 AM MST · https://x.com/Venu_7_/status/2099176631147561316

17,912 impressions **271** likes **275** bookmarks **36** reposts **10** replies

Want to Know If the Market Is Topping or Just Resetting for the Next Leg Higher? Read this.

Stan Weinstein's framework gives us one of the simplest ways to answer it.

The Nasdaq ran 34% from the March low to the June high.

Then it spent three months going nowhere.The key is the 30-week moving average.

Stage 2 pause:
- 30-week MA still rising
- Price holds above it, pullbacks find support near the line
- Down weeks come on lighter volume
- The range eventually resolves higher

Stage 3 top:
- 30-week MA flattens out
- Price whips above and below the line
- Heavy volume shows up on down weeks
- Rallies keep failing at the same level

Right now, **$QQQ** sits above a 30-week line that is still rising.

By Weinstein's framework, that looks more like a Stage 2 pause than a Stage 3 top.

That can change. The line flattening is the tell.

Until it does, the trend gets the benefit of the doubt.

Sideways above a rising line = pause.
Sideways through a flat line = potential top.

The market doesn't need to go up every week to remain in an uptrend.

Sometimes the strongest moves come after months of doing nothing. We've seen this again and again - October 2023, April 2025, November 2025, and March 2026 are some of the best examples.

Until the 30-week MA tells us otherwise, the primary trend remains intact.

RESTING OR TOPPING?

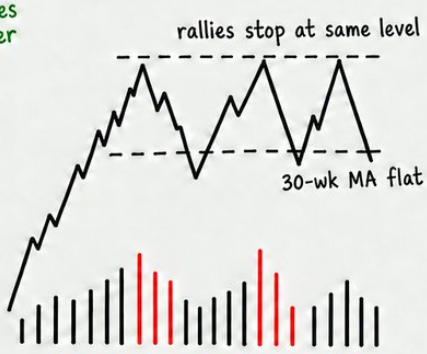

Stan Weinstein: Stage 2 pause vs Stage 3 top

STAGE 2 PAUSE

down weeks on light volume.

STAGE 3 TOP

heavy volume on down weeks.

ASK 4 QUESTIONS

1. is the 30-wk MA still rising?
2. is price holding above it?
3. do pullbacks hold the line?
4. are down weeks light volume?

yes to all = pause, not a top

Sideways above a rising line is a pause.
Sideways through a flat line is a potential top.

STAGE ANALYSIS & TREND

The index has gone sideways for three months.

Sep 12, 2026 · 10:06 AM MST · https://x.com/Venu_7_/status/2098820563305369727

44,508 impressions **555** likes **607** bookmarks **72** reposts **23** replies

The index has gone sideways for three months.

Most people see that as dead money.

William O'Neil saw it as the most important research window of the cycle.

While the market chops, the next leaders are quietly building bases. When the market turns, they are the first stocks out.

Here is what to look for:
- The stock is holding above its 50-day line while the index struggles
- Its relative strength line is at or near new highs, meaning it is outperforming a flat market
- It is forming a recognizable base near its highs: cup with handle, flat base, or double bottom
- Volume dries up inside the base. The sellers are running out.
- Earnings and sales growth are still accelerating underneath

That is your watchlist for the next leg:

$NBIS $SMTC $INTC $BE $GLW $CRM $NOW $PLTR $ABNB $FIVN $TEAM $CRWD $NET $TWLO $FROG $FTNT $PANW $RBRK $HPE $DELL $HPQ $ANET $APH $COHU $MRVL $AMD $NVDA $MU $SNDK $U $NTAP $FORM

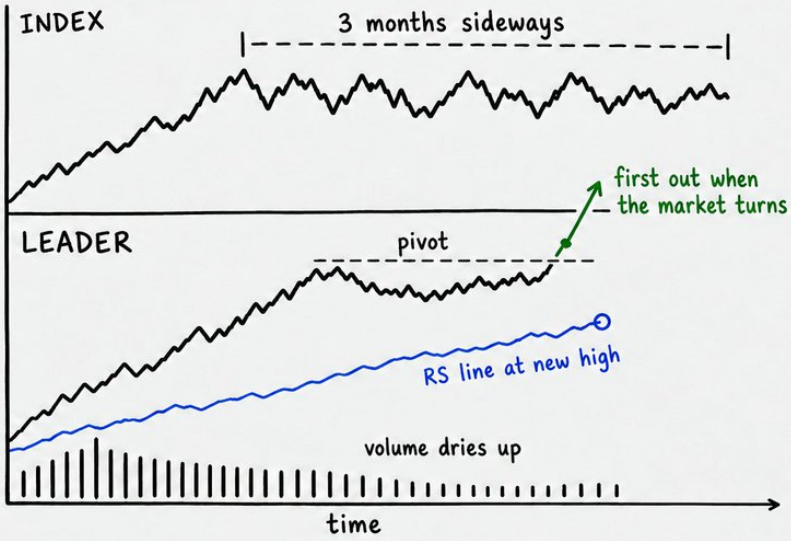

You do not need to predict when the market turns. You need to have the list ready for when it does.

The index tells you when.

The stocks holding up best tell you what.

THE NEXT LEADERS ARE BUILDING NOW

William O'Neil: where to look while the market chops

WATCHLIST TEST

1. holding above the 50-day line
2. RS line at or near new highs
3. forming a tight base (cup, flat, W)
4. volume dries up inside the base
5. EPS and sales growth still strong

The index tells you when.
The stocks holding up best tell you what.

William O'Neil's Double Bottom is one of the classic patterns for identifying a potential trend change.

Sep 9, 2026 · 9:38 AM MST · https://x.com/Venu_7_/status/2097726254409810143

27,517 impressions **390** likes **352** bookmarks **50** reposts **18** replies

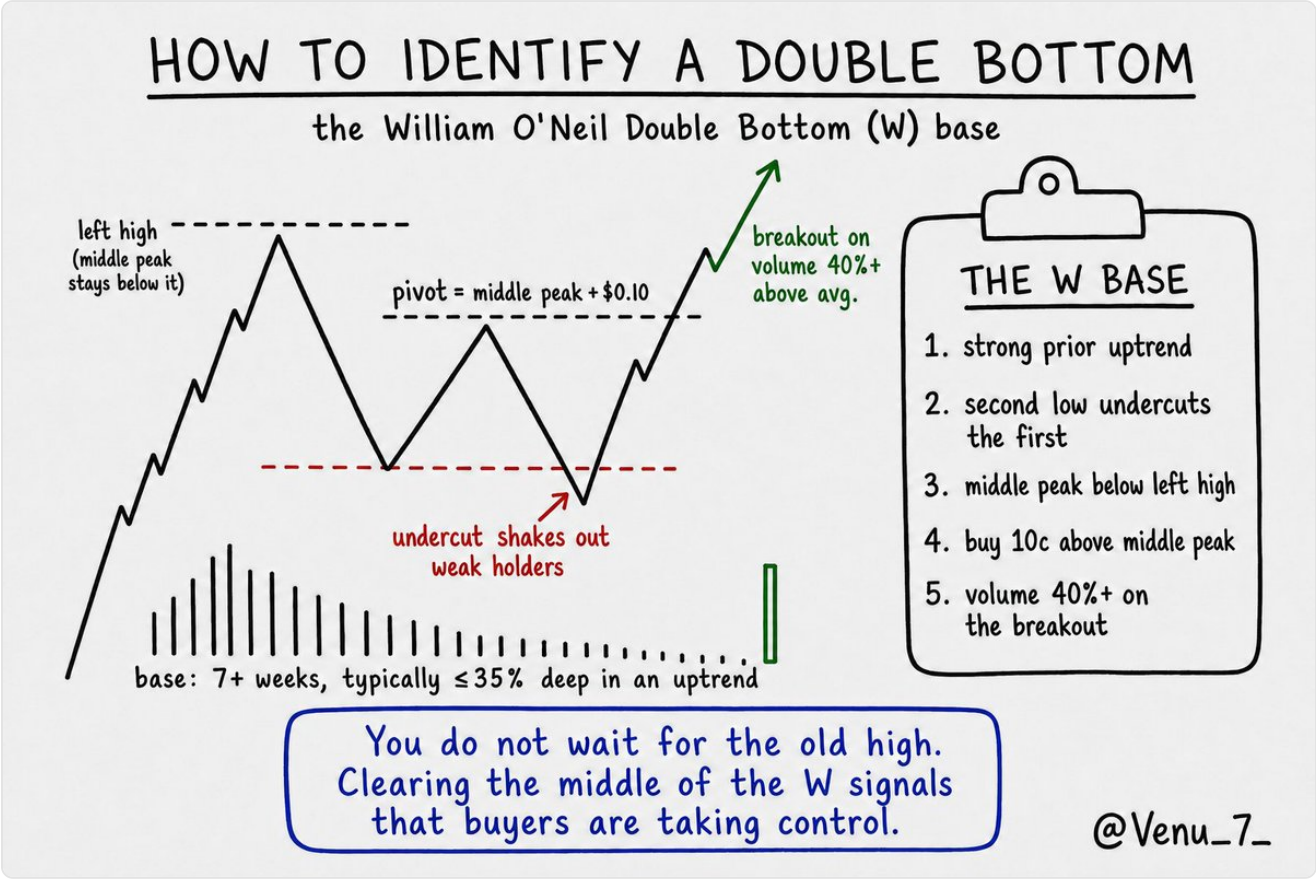

William O'Neil's Double Bottom is one of the classic patterns for identifying a potential trend change.

The Double Bottom is the classic W base:
- Stock pulls back after a strong run, bounces, then sells off again
- The second low undercuts the first, shaking out weaker holders
- The middle peak of the W stays below the left-side high
- The base typically needs at least 7 weeks and is usually 35% deep or less
- Buy point: $0.10 above the middle peak, ideally with volume at least 40% above average

You don't wait for the old high.

Clearing the middle of the W signals that demand has absorbed the second selloff.

That's what makes this pattern so useful - it can signal the transition from a downtrend into a new uptrend.

STAGE ANALYSIS & TREND

In 1997, Mark Minervini won the U.S. Investing Championship with a 155% return.

Sep 6, 2026 · 3:21 PM MST · https://x.com/Venu_7_/status/2096725417185182181

In 1997, Mark Minervini won the U.S. Investing Championship with a 155% return.

Stocks only.

One of the most important patterns behind his approach is something you can spot on almost any chart:
- Strong prior uptrend
- Each pullback gets smaller: 25% → 15% → 8% → 3%
- Volume dries up as price gets tighter
- Supply starts disappearing as fewer sellers are willing to sell
- Breakout through the pivot as demand returns

Each contraction tells you something: sellers are becoming less aggressive, while buyers are willing to step in at progressively higher levels.

He calls it the Volatility Contraction Pattern (VCP).

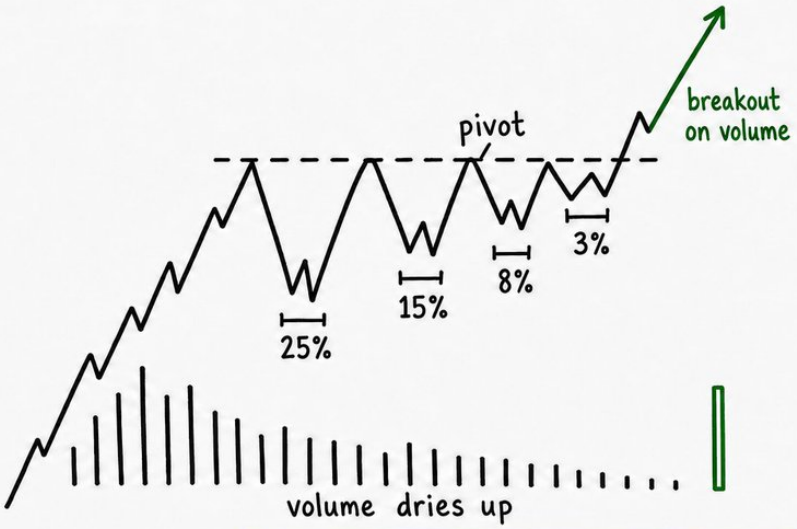

The idea is simple:
When a stock refuses to go down while volume dries up, pay attention.

It may be moving toward the point of least resistance.

Tighter before higher.

TIGHTER BEFORE HIGHER

the Mark Minervini VCP - Volatility Contraction Pattern

THE VCP

1. strong prior uptrend
2. each pullback shallower
3. volume dries up
4. buy the pivot breakout

Supply starts disappearing as fewer sellers are willing to sell.

I've been fortunate to catch multiple multibaggers this year, and there's one thing most of them had in common - I positioned while the base was still forming, not after the breakout.

I try to look at the bigger picture and position when I believe the fundamentals are reaching an inflection point while the technical setup is still developing.

If you get that combination right, you don't have to wait for everyone else to recognize the breakout.

$MRVL and **$ARM** were two great examples for me this year. I positioned in both early and was able to capture roughly 160% returns on each within about 3 months.

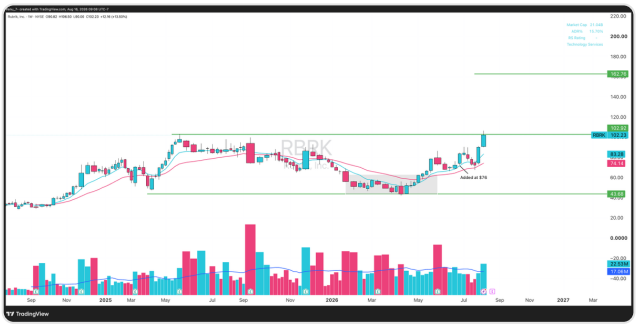

Now I'm trying to apply the same framework with **$RBRK** and **$PLTR**.

Fundamentals first. Technicals confirm eventually.

This approach has probably been one of my biggest edges over the years.

A few things I look for:
- The stock has gone through a meaningful drawdown after an Impressive run, reclaimed the 200-day SMA and is still building a base
- Recent earnings show the business is inflecting - especially EPS growth accelerating 20-30%+ YoY
- Institutional accumulation starts showing up before the breakout
- Relative strength improves while the stock is still inside the base
- Key moving averages start flattening and turning higher
- It should looks like it's transitioning from Stage 1 into a potential Stage 2 uptrend

You won't get every one of these perfectly aligned, but the more boxes that are checked, the more interested I become.

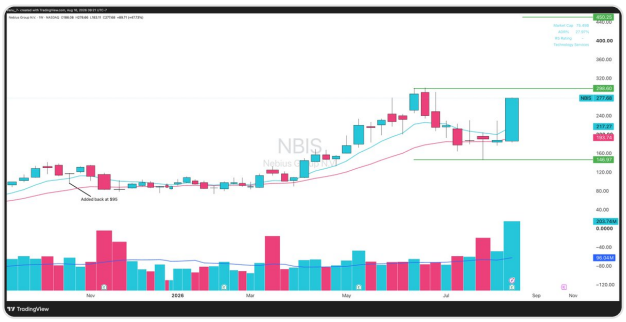

Thread reply 1/1 · link

while I sold **$ARM** & **$MRVL** but I still hold my long term semi/AI infra conviction names like **$MU** and **$NBIS**

$AXON – Axon is building a software + hardware ecosystem for public safety with TASERs, body cameras, and AI-powered software.

One of the best examples of Stan Weinstein's Stage Analysis:

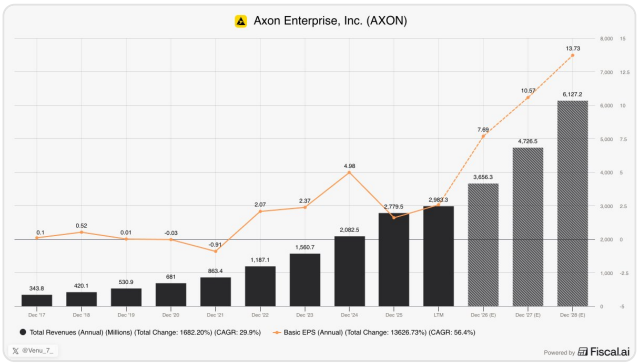

- Completed a Stage 4 decline
- Built a 6-month Stage 1 base
- Reclaimed the 200-day SMA & ATH AVWAP

Now it's attempting to kick off a new Stage 2 uptrend.

Fundamentals:
Revenue: $344M -> $3.0B (LTM) -> $6.1B by 2028E
EPS: $2.98 (LTM) -> $13.73E by 2028

The biggest winners often emerge when a Stage 1 base transitions into a new Stage 2 advance.

STAGE ANALYSIS & TREND

One of William O’Neil’s most important lessons:

Jul 4, 2026 · 1:17 PM MST · https://x.com/Venu_7_/status/2073501560194437157

16,622 impressions **192** likes **78** bookmarks **21** reposts **7** replies

One of William O’Neil’s most important lessons:

New bases form during market corrections.

During a correction, leading stocks often stop advancing and begin consolidating. Weak holders exit, institutions gradually accumulate shares, and a new base starts to form.

When the market confirms a new uptrend, these are often the first stocks to break out and lead the next rally.

Don’t spend corrections trying to predict the bottom. Spend them building your watchlist.

Want to study how major leaders top out?

Study the **$GLD** chart.

• After forming a massive 12-year cup & handle, Gold broke out in January 2024 and rallied nearly +170%. This is exactly why I pay close attention to big, multi-year bases.

• I call this framework "4 Bases & 4 Runs." After breaking out of multi-year or multi-decade bases, many leaders tend to advance in a series of bases followed by powerful runs. I've seen similar behavior in names like **$GLD**, **$SLV**, and even **$MSTR** in 2024.

• During these uptrends, leaders often consolidate and backtest key moving averages like the 21-day EMA and 50-day SMA before beginning their next leg higher.

• The real lesson comes at the end. On the fourth run, notice the climactic volume spike - the highest since the initial breakout. The very next day, price gaps down sharply. That's often a sign that liquidity is drying up and the move is becoming exhausted.

It doesn't mean the asset crashes immediately. Dip buyers can still show up. But more often than not, the easy money phase is over, and the stock or commodity enters a much longer period of consolidation before its next major cycle begins.

Study how leaders begin. Study how they end.

The exits are often hidden in plain sight.

If you found this helpful, feel free to share.

Thread reply 1/1 · link

Before the gold bugs come after me...

Yes, **$GLD** recently lost its 200-day SMA.

And yes, long term I think Gold will do just fine.

This post isn't "sell all your gold." It's about recognizing when a stock or commodity is entering the late stages of a major move and when it might be time to reduce exposure or take profits.

Also, my mom has been buying gold since the 1980s and has never sold a single gram.

If she sees this post, there's a very good chance I won't be allowed back into the house the next time I visit India. 😂

“High, Tight Flag” patterns are extremely rare and usually appear in only a handful of stocks during strong bull markets.

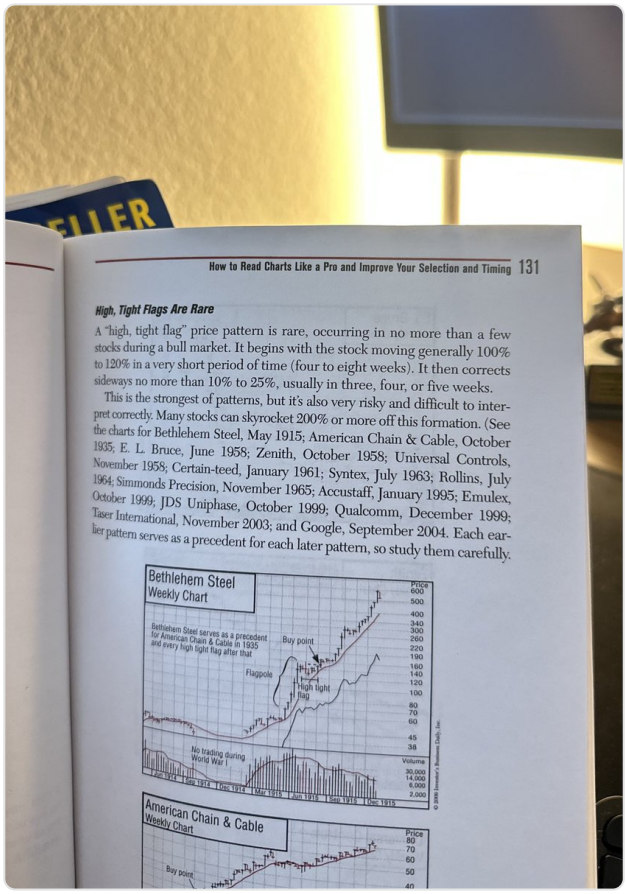

According to William O’Neil, many of the greatest winners in history formed this setup before rallying another 200%+.

The pattern:
- 100%+ move in 4-8 weeks
- Tight sideways consolidation
- Shallow pullback
- Strong institutional demand

Few current names that somewhat fit the criteria:
$DIOD $KLIC $HIMX $MRAM

Thread reply 1/1 · link

High, Tight Flags Are Rare

A "high, tight flag" price pattern is rare, occurring in no more than a few stocks during a bull market. It begins with the stock moving generally 100% to 120% in a very short period of time (four to eight weeks). It then corrects sideways no more than 10% to 25%, usually in three, four, or five weeks.

This is the strongest of patterns, but it's also very risky and difficult to interpret correctly. Many stocks can skyrocket 200% or more off this formation. (See the charts for Bethlehem Steel, May 1915; American Chain & Cable, October 1935; E. L. Bruce, June 1958; Zenith, October 1958; Universal Controls, November 1958; Certain-teed, January 1961; Syntex, July 1963; Rollins, July 1964; Simmonds Precision, November 1965; Accustaff, January 1995; Emulex, October 1999; JDS Uniphase, October 1999; Qualcomm, December 1999; Taser International, November 2003; and Google, September 2004. Each earlier pattern serves as a precedent for each later pattern, so study them carefully.

Stan Weinstein Stage Analysis is one of the core pillars of my strategy.

Feb 22, 2026 · 7:30 PM MST · https://x.com/Venu_7_/status/2025760160476778815 · 🧵 thread

14,526 impressions **120** likes **100** bookmarks **11** reposts **10** replies

Stan Weinstein Stage Analysis is one of the core pillars of my strategy.

Stocks move in 4 stages driven by institutional accumulation and distribution:

Stage 1 - Base: price moves sideways, 30-week MA flattens, smart money accumulates.

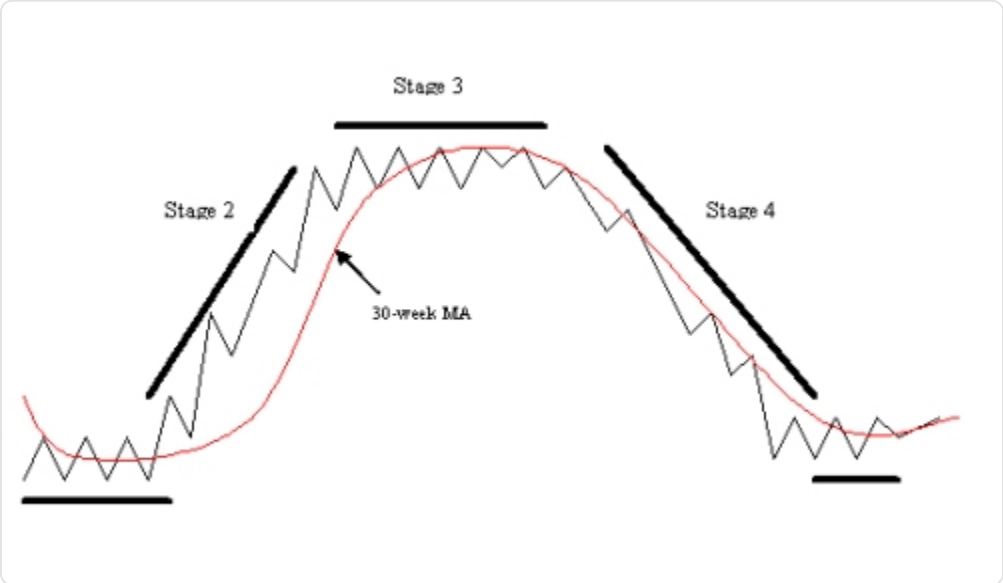

Stage 2 - Uptrend: breakout above resistance with rising 30-week Moving Average. This is where big money is made.

Stage 3 - Top: price stalls, volatility increases, institutions start selling.

Stage 4 - Downtrend: breakdown below support, falling 30-week MA. This is where most losses happen.

My focus is simple: buy Stage 2, avoid Stage 4.

This alone can save you from major drawdowns and keep you aligned with winning stocks.

> Thread reply 1/1 · link
>
> This framework helped me avoid buying software and crypto names that are now in Stage 4 drawdowns.

Let me tell you something they won't teach you in books or courses.

Everyone talks about buying stocks in Stage 2 uptrends. Fine. But almost no one talks about what happens when Stage 2 fails or how to define invalidation.

Here's how I look at it.

$SE is the perfect example.

After a 90% drawdown, the stock spent nearly two years in Stage 1, building a massive base between $35 and $90. It then reclaimed IPO VWAP - a critical long-term level & successfully retested it, and resumed its uptrend.

As long as price holds above the Stage 1 breakout base and IPO VWAP, the structure remains intact. That nuance isn't taught in books.

If **$SE** pulls back toward the $97 area, that's where the best risk-to-reward sets up.

MOVING AVERAGES & AVWAP

Anchored VWAP is one of the most underrated tools in technical analysis.

Aug 23, 2026 · 1:12 PM MST · https://x.com/Venu_7_/status/2091619606737875140 · 🧵 thread

58,371 impressions **608** likes **580** bookmarks **63** reposts **23** replies

Anchored VWAP is one of the most underrated tools in technical analysis.

One of my favorite ways to use it is Earnings AVWAP.

When a stock gaps after earnings on massive institutional volume, I anchor VWAP from that earnings day.

Why?

That earnings gap often becomes a major character change for the stock, and AVWAP tracks the volume-weighted average price since that move started.

If the stock pulls back weeks or even months later and finds support around Earnings AVWAP, I pay attention.

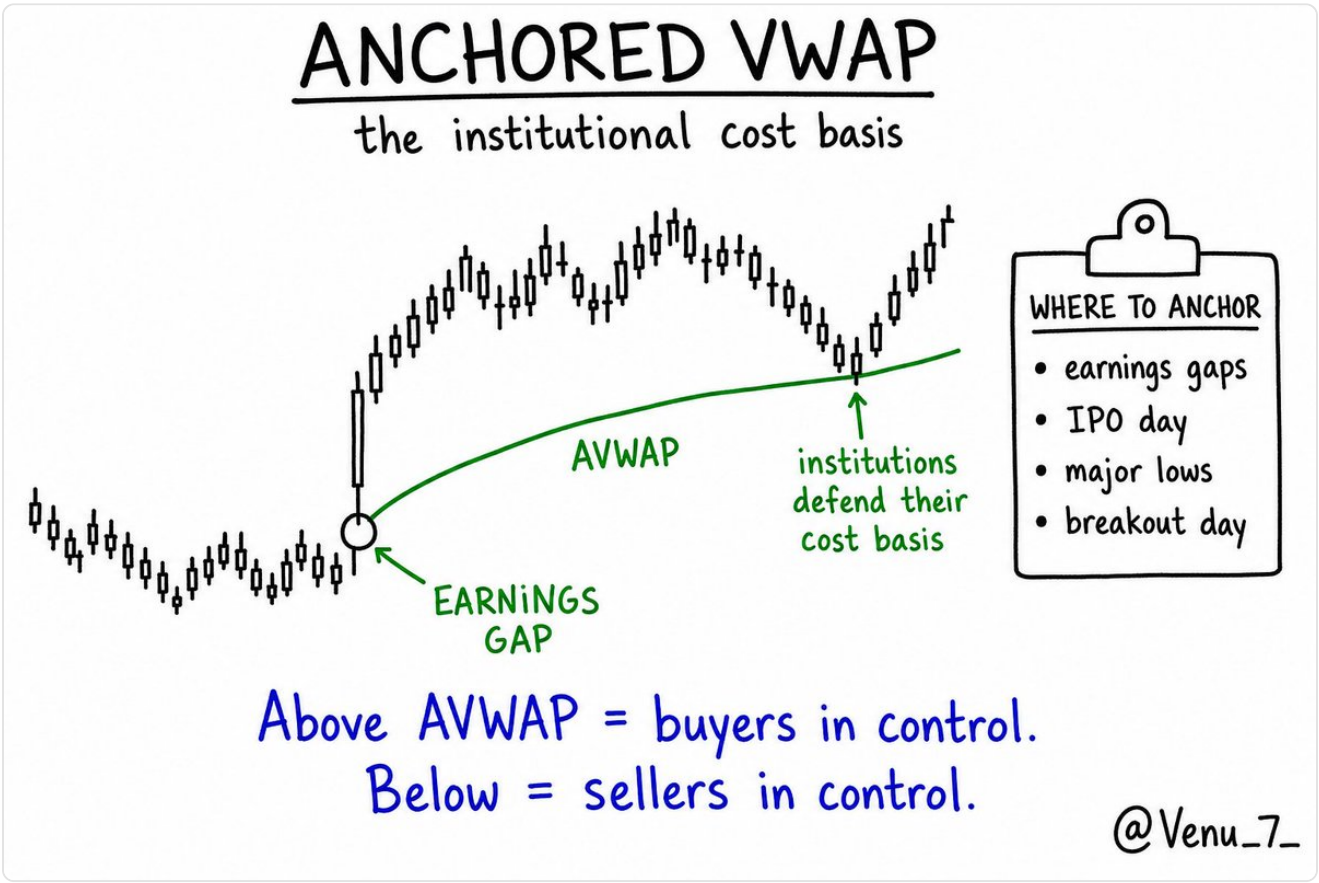

Above AVWAP -> buyers generally in control.
Below AVWAP -> sellers generally in control.

A reclaim or strong bounce from Earnings AVWAP can also give you a great area to manage or build a position when the fundamental thesis remains intact.

I don't use AVWAP alone.

Combine Earnings AVWAP + institutional volume + Stage Analysis + moving averages and it becomes a very useful framework for understanding where buyers may step back in.

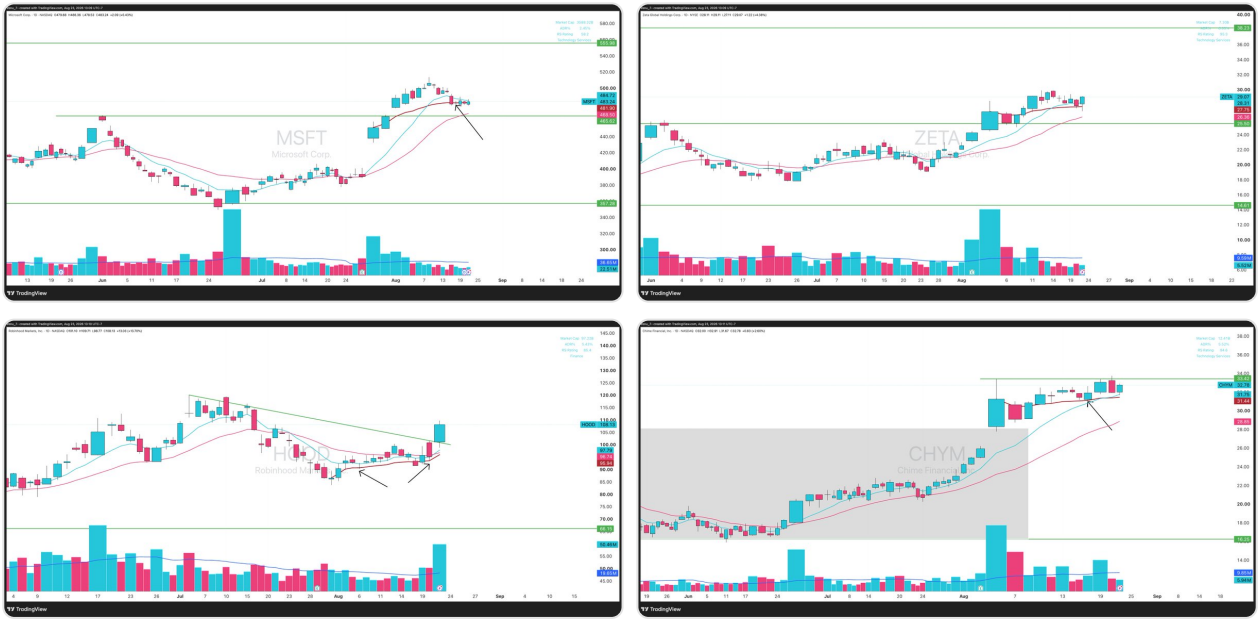

Find the strongest leaders. Let the pullback come to you.

Jul 27, 2026 · 8:13 AM MST · https://x.com/Venu_7_/status/2081759823776137292

65,212 impressions **224** likes **159** bookmarks **14** reposts **17** replies

My advice is simple:

Find high-quality companies in AI, tech, or any sector you believe has a strong future, and pay close attention to the ones holding above their 200-day moving average during pullbacks and market corrections.

Go back and study November 2023, August 2024, April 2025, November 2025, and March 2026. The stocks that respected their 200-day moving average and fit the CAN SLIM framework made some of the strongest recoveries once the market turned higher.

From a fundamental perspective, EPS growth is key. I prefer companies with 30%+ YoY EPS growth and improving estimates over the next few years.

That's where I'd focus my attention.

Trust me, if I had listened to the majority of FinX during every market correction or pullback, I probably wouldn't have achieved the returns I have over the past few years.

I've learned that following a disciplined process beats following the crowd.

MOVING AVERAGES & AVWAP

Why does the 50-day moving average matter?

Jul 6, 2026 · 8:00 AM MST · https://x.com/Venu_7_/status/2074146434257912087

Why does the 50-day moving average matter?

William O'Neil found that many of history's biggest stock market winners repeatedly found support at the 50-day moving average before making their next leg higher.

But not every 50-day test is worth buying.

The best ones usually:
- Have strong earnings & revenue growth
- Are true market leaders
- Pull back on lighter volume
- Find support and reclaim the 50-day with strong demand

The 50-day isn't a buy signal by itself. It's where institutions often add to exceptional businesses.

14,675 impressions **202** likes **141** bookmarks **21** reposts **11** replies

Why IPO VWAP Matters?

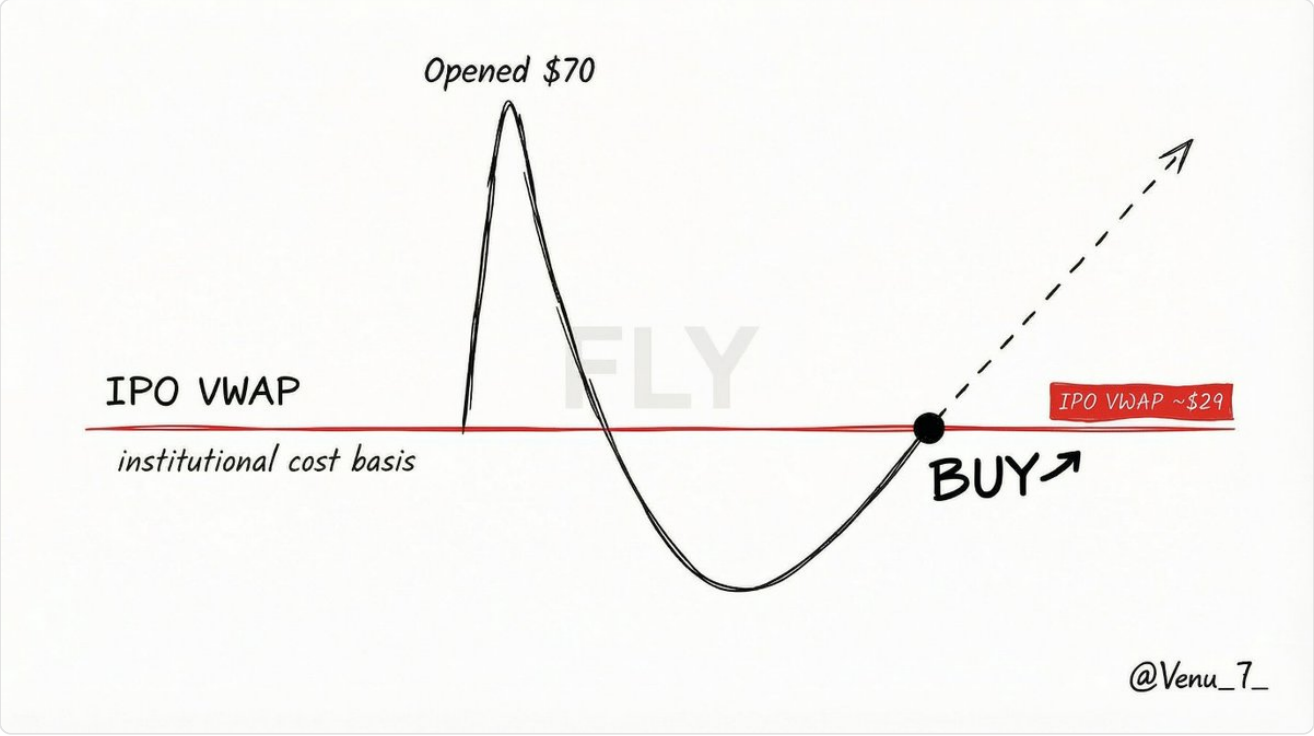

IPO VWAP is the average price institutions paid on day one. It's their cost basis - and they tend to defend or add when the stock comes back to it. That makes it one of the cleanest levels on the chart.

How to use it:

Uptrending stock holding above IPO VWAP = institutional support confirmed
Stock reclaiming IPO VWAP after a sell-off = potential inflection, watch for entry
Stock stuck below IPO VWAP = distribution, not accumulation

$FLY is the textbook example right now. IPO priced at $45, ran to $70 on day one. Sold off hard to $18 - well below VWAP. Now it's reclaiming $29 (IPO VWAP). Institutions are back at cost basis. That's the signal.

Most traders only watch the IPO price. The better traders watch IPO VWAP. One is a number on a prospectus. The other is where the real money is positioned.

What is IPO VWAP & why it matters:

It's the volume-weighted average price from the IPO day - essentially the average price institutions bought shares at on day one.

IPO VWAP often becomes a major support level because many institutions use it as their cost basis and tend to defend or add when the stock revisits that level.

A few stocks currently sitting near IPO VWAP:

My honest advice is never chase entries. If you do, when the stock pulls back to moving averages, you'll likely be deep in the red. If it's not for you, let it go.

There will always be thousands of opportunities. Build good habits first - money follows process.

MOVING AVERAGES & AVWAP

Most people use Relative Strength Index (RSI) wrong way.

7,712 impressions **121** likes **39** bookmarks **8** reposts **12** replies

Most people use Relative Strength Index (RSI) wrong way.

The common belief:

RSI oversold = buy
RSI overbought = sell

That logic works in ranges, not in strong trends.

In real momentum names, overbought often means strong demand not a sell signal.

Look at Micron Technology **$MU** or SanDisk **$SNDK**

RSI stayed around 70–80 for months and price kept trending higher. That's strength, not exhaustion.

On the downside, oversold doesn't mean cheap. Weak stocks can stay weak longer.

RSI is a momentum tool, not a timing signal. Context matters.

Do you want to know how I identify great setups?

Let's take **$ALM** as an example:

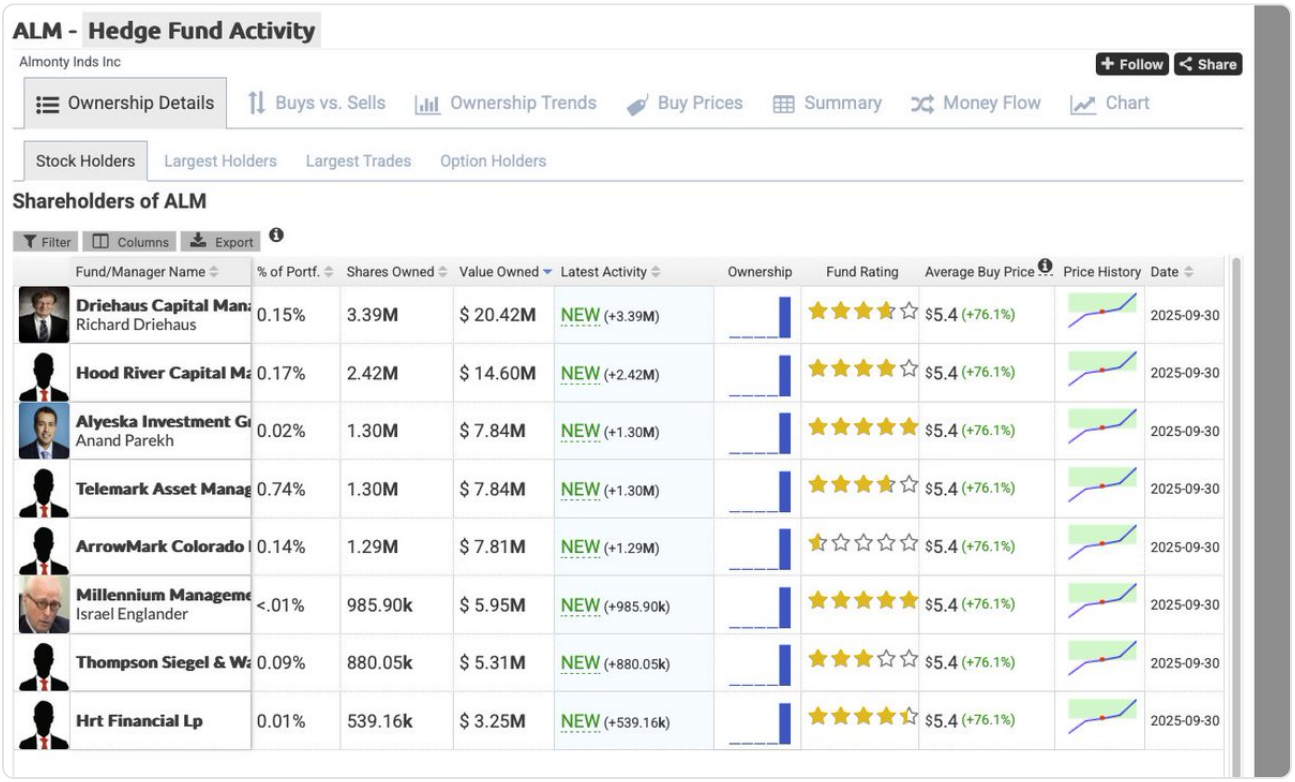

- Respected IPO VWAP - tells me institutions are involved and technicals matter
- During the November pullback, it didn't even test the 200-day MA trend strength intact
- Volume patterns shows clear accumulation, not distribution
- Trading above all key moving averages and sitting near a breakout zone
- Right catalyst in place: Metals & Minerals

That's how strong setups quietly form before the move.

MOVING AVERAGES & AVWAP

Why 200 day moving average matters?

Nov 18, 2025 · 9:29 AM MST · https://x.com/Venu_7_/status/1990819547579097318

15,257 impressions **141** likes **131** bookmarks **10** reposts **5** replies

Why 200 day moving average matters?

The 200-day moving average matters for one reason: it separates long-term uptrends from everything else.

1/ Institutions use it

Pension funds, hedge funds, CTA models - they all track the 200-day. When price is above it, funds stay long or add risk. Below it, they reduce exposure.

2/ Represents the long-term trend

200 days is roughly 40 trading weeks. If price holds above it, the market is in a structural uptrend. If it breaks and stays below, momentum shifts negative.

3/ It filters noise

Short-term volatility doesn't matter. A stock can survive dips and earnings drama, but if it loses the 200-day with volume, that's real signal.

4/ Defines institutional support

Strong companies consistently bounce at the 200-day. Weak ones fail there. Stage 2 leaders rarely break it during strong cycles.

5/ Risk management anchor

Owning stocks above the 200-day helps avoid blow-ups. Buying leaders as they reclaim it puts you early in the next advance.

6/ Works across decades

Same behavior in 2000, 2008, 2020, 2022, and every bull recovery.

Summary:
Above the 200-day = healthy long-term trend.
Below the 200-day = caution.

So far, we’re in some solid setups. Try to understand the reasoning behind the trades.

One thing you’ll notice in my trades—most are above the 9/21 EMA. I avoid stocks trading below those levels. If a stock closes below the 21 EMA, there’s a higher chance it will test the 50 MA.

My swing trade success comes from picking stocks with PEG candles or strong bullish setups that stay above the 9/21 EMA.

Accumulation/distribution & volume

ACCUMULATION/DISTRIBUTION & VOLUME

One of the most important concepts every trader and investor should understand is Accumulation vs. Distribution.

Oct 25, 2026 · 3:51 PM MST · https://x.com/Venu_7_/status/2114490130589442251

18,947 impressions **233** likes **278** bookmarks **33** reposts **12** replies

One of the most important concepts every trader and investor should understand is Accumulation vs. Distribution.

Price tells us the direction. Volume helps us understand the conviction behind the move.

Here's how I look at it:

1/ ACCUMULATION - Institutional Buying
What I look for:
- Up days on above-average volume
- Pullbacks on declining volume
- Strong closes near daily or weekly highs
- Tight price action with decreasing volatility
- Key support levels consistently holding
- Improving relative strength

Why does it matter?

Large institutions often take weeks or months to build positions, leaving potential footprints through price and volume.

This behavior is commonly seen during late Stage 1 bases and healthy Stage 2 uptrends.

2/ DISTRIBUTION - Institutional Selling
What I look for:
- Down days on above-average volume
- Weak rallies on declining volume
- Repeated closes near daily or weekly lows
- Wide, loose price swings
- Heavy volume without upward progress (churning)
- Breakdowns below key support levels

Why does it matter?
Repeated selling pressure can indicate institutions reducing exposure, often appearing during Stage 3 topping formations before potential Stage 4 declines.

3/ THE SIMPLEST WAY TO REMEMBER IT
- Accumulation → Up on strong volume, down on lighter volume.
- Distribution → Down on strong volume, up on lighter volume.

These are clues, not guarantees. Look for repeated patterns rather than isolated sessions.

4/ WHAT ABOUT THE BROADER MARKET?
William O'Neil's CANSLIM framework emphasizes tracking distribution days in major indexes.

A distribution day generally occurs when an index declines on higher volume than the previous session.

Roughly 4-5 distribution days within several weeks can be an early warning of increasing institutional selling pressure.

Not an automatic sell signal, but a reason to become more defensive.

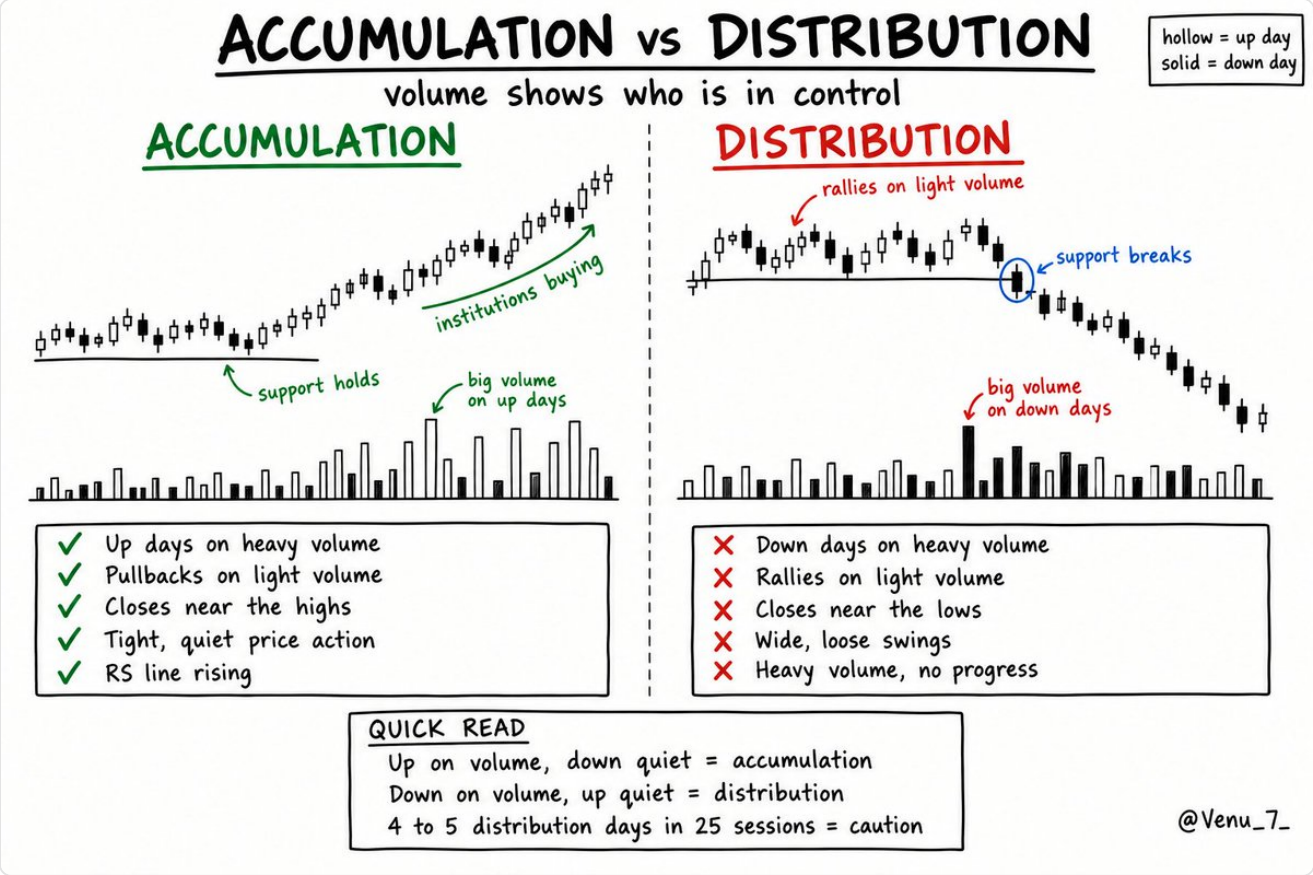

5/ HOW I APPLY THIS TO MY TRADING & INVESTING
- Accumulation → Look for constructive entries, build positions selectively, and let strong trends develop.
- Distribution → Tighten risk management, avoid aggressive additions, and reassess technically weak positions.

One thing I've learned over the years: Never analyze price without looking at volume!

Combine price and volume with Stage Analysis, relative strength, and fundamentals, and you'll have a much stronger framework for navigating the markets.

Note: Don't automatically treat heavy volume without significant price movement as distribution, especially on OpEx or major void days, when unusually high volume may not reflect meaningful institutional selling.

Remember the Power Earnings Gap(PEG) Low concept I talked about a few days ago?

It often acts as strong support and can provide excellent risk/reward entries.

We're seeing it play out in **$SNOW $OKTA $TWLO**. It didn't work in **$AKAM**, and that's okay - no framework has 100% hit rate!

The key is to study why it works, when it works, and combine it with fundamentals, volume, and overall market direction. That's where the edge comes from.

There is one concept I don't think I've ever seen properly explained in books or on FinX:

The low of a Power Earnings Gap (PEG) often acts as a major support level.

Why?

Because a PEG isn't just a technical event. It's a fundamental re-rating.

Institutions realize the company is worth much more than they previously thought. They rush to build positions, creating a large imbalance between buyers and sellers.

The result? That earnings gap becomes an area where institutions often defend their positions.

When price revisits the low of the PEG candle on lighter volume, it can offer one of the best low-risk, high-reward entries:

Your risk is clearly defined below the PEG low.
The reward can be substantial if the stock resumes leadership.
You're buying where big money previously stepped in.

Of course, it doesn't work every time. But in true market leaders, the PEG low often tells you where institutional conviction lives.

$SNOW $AKAM are good examples of that concept playing out right now.

Past example **$JBHT $KEYS**

ACCUMULATION/DISTRIBUTION & VOLUME

$VICR - how to identify a true leader in a theme?

Feb 27, 2026 · 8:29 AM MST · https://x.com/Venu_7_/status/2027405830682034502

6,471 impressions **44** likes **22** bookmarks **2** reposts **7** replies

$VICR - how to identify a true leader in a theme?

Look for heavy accumulation, strong earnings growth, and relative strength when the market is weak. Leaders rarely break down and often hold above the 9-day EMA.

$VICR clearly fits the leader category.

Always pay attention to big bases and clean breakouts - that's where real leaders emerge.

$META – long term, no doubt about the company.

Oct 31, 2025 · 11:45 AM MST · https://x.com/Venu_7_/status/1984330782752801242

258,745 impressions **599** likes **276** bookmarks **54** reposts **74** replies

$META – long term, no doubt about the company.

But when a stock loses its 200-day SMA with heavy distribution after earnings, at least follow the 3-day rule.

Ideally, I'd like to see it hold support and form a mini base before adding.
The 3-day rule:
Day 1 – panic selling
Day 2 – continued pressure
Day 3 – stabilization and calmer entries

If I have to buy, $530 would be my entry Since it's AVWAP held through April 2025 pullback and strong support level!

RISK, POSITION SIZING & SELLING

One of the most expensive mistakes in the stock market is confusing high conviction with taking excessive risk.

Oct 24, 2026 · 10:44 AM MST · https://x.com/Venu_7_/status/2114050329750941938 · 🧵 thread

16,333 impressions **150** likes **62** bookmarks **8** reposts **14** replies

One of the most expensive mistakes in the stock market is confusing high conviction with taking excessive risk.

Even the best companies can experience massive drawdowns.

Here's why POSITION SIZING can make or break your portfolio.

You can identify a great company, have a strong investment thesis, and even get the technical setup right, but poor position sizing can still destroy your portfolio.

Here's something every trader and investor should understand:
- 10% position falling 30% costs your portfolio 3%.
- 25% position falling 30% costs your portfolio 7.5%.
- 50% position falling 30% costs your portfolio 15%.

Same stock. Same decline. Completely different consequences.

A few lessons I've learned over the years:
- Never let conviction turn into overconfidence. Even your highest-conviction ideas can fail.
- Size positions based on risk, not excitement. Smaller, more volatile companies generally deserve smaller allocations.
- Protect your ability to stay in the game. A 50% portfolio drawdown requires a 100% gain just to recover.

Remember, the goal isn't to make the most money from a single stock.

The goal is to compound your capital consistently over many years without allowing one mistake to wipe out years of hard work.

You don't need to be right on every trade or investment to become successful.

But you absolutely need to survive the times when you're wrong.

Position sizing is what keeps you in the game.

RISK, POSITION SIZING & SELLING

One of the biggest lessons I’ve learned:

Sep 21, 2026 · 4:59 PM MST · https://x.com/Venu_7_/status/2102185965091786904

28,244 impressions **462** likes **67** bookmarks **16** reposts **32** replies

One of the biggest lessons I’ve learned:

When the market spends months consolidating after a major move, don’t be in a hurry to sell your winners when the next leg begins.

Don’t collect pennies when the market is offering you dollars.

We saw how violent the June 2025 rally was. We saw it again in April 2026.

The hardest part isn’t finding a winner. It’s holding it long enough to let it become a big winner.

RISK, POSITION SIZING & SELLING

Jesse Livermore's approach to position sizing was built around confirmation.

Sep 7, 2026 · 3:57 PM MST · https://x.com/Venu_7_/status/2097096888915030157

19,275 impressions **331** likes **223** bookmarks **44** reposts **19** replies

Jesse Livermore's approach to position sizing was built around confirmation.

Rather than building a full position immediately, his approach was to increase exposure as price confirmed the trade.

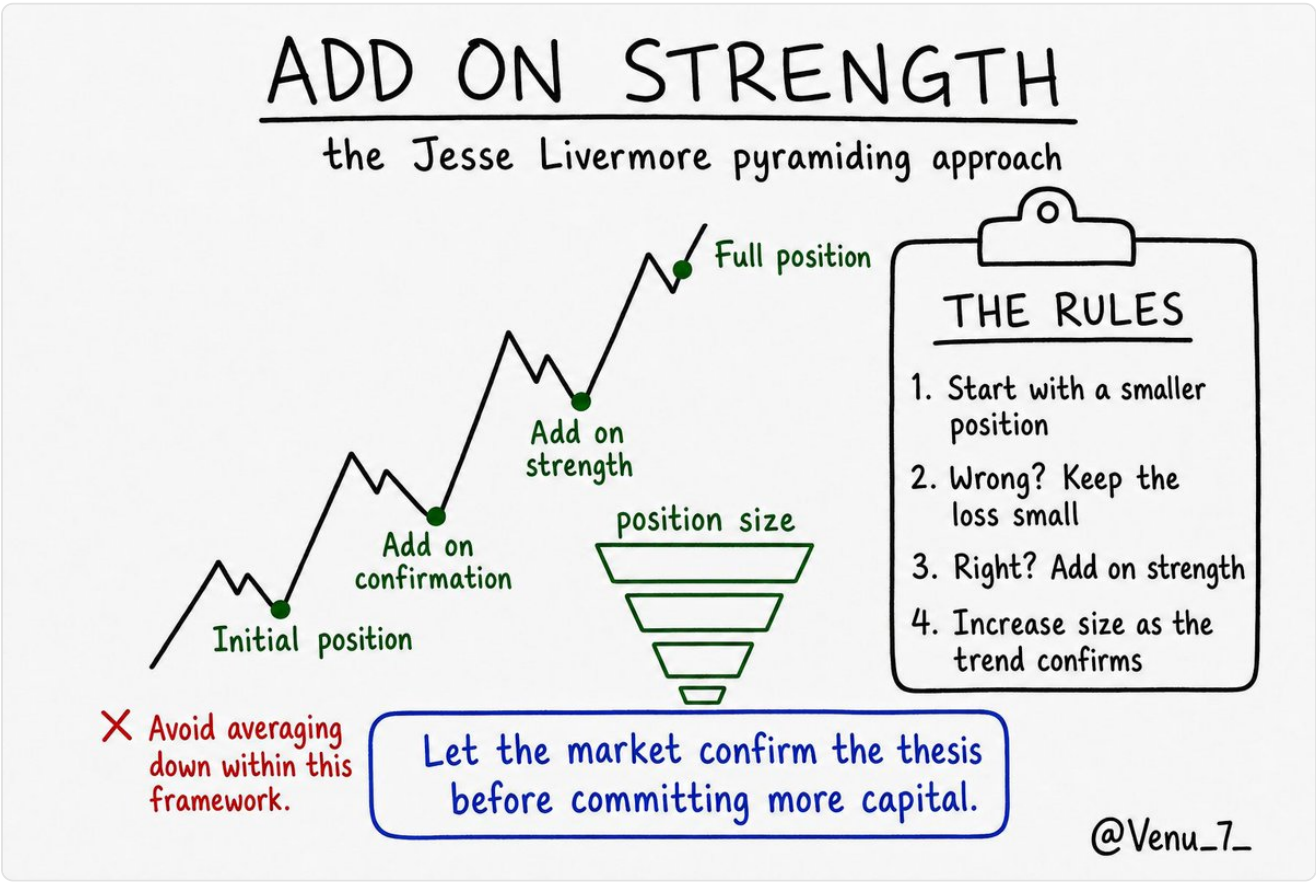

- Start with a smaller initial position
- If price moves against the thesis, keep the loss small
- If price confirms the thesis, add on strength
- Continue increasing size as the trend develops
- Avoid averaging down within this framework

The advantage is simple: your smallest exposure is when uncertainty is highest, while your largest exposure comes after the trend has provided more confirmation.

This isn't the only way to build a position. Long-term investors and different trading styles may use very different approaches.

But within Livermore's framework, the objective wasn't to get the lowest possible entry.

It was to commit more capital as the market provided more evidence that the trade was working.

RISK, POSITION SIZING & SELLING

Stanley Druckenmiller ran Duquesne for 30 years.

Sep 5, 2026 · 11:06 AM MST · https://x.com/Venu_7_/status/2096298818186707296 · 🧵 thread

19,757 impressions **215** likes **125** bookmarks **22** reposts **20** replies

Stanley Druckenmiller ran Duquesne for 30 years.

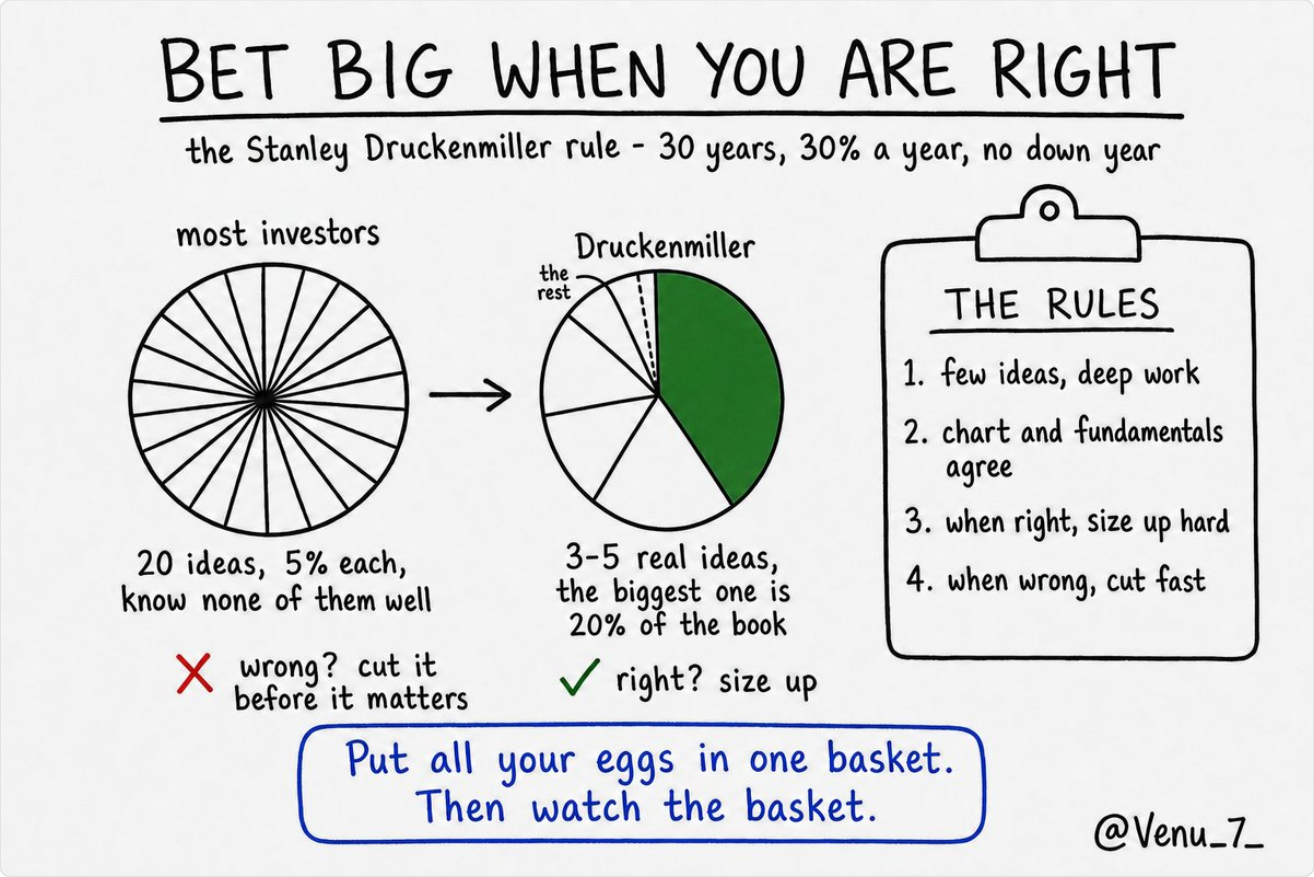

30%+ a year. Not one down year.

His edge wasn't being right more often. It was what he did when he was right.
- Diversification is for people who don't know what they own
- Find the 3-5 ideas you understand better than anyone
- Let the best one be big. His top holding today is 20% of the book.
- When the fundamentals and the chart agree, size up hard
- When you're wrong, cut it before it matters

That's it.

"It's not whether you're right or wrong. It's how much you make when you're right and how much you lose when you're wrong."

Put all your eggs in one basket. Then watch the basket.

Thread reply 1/1 · link

Correction:

> Diversification itself isn't the issue. The better takeaway is to concentrate capital in your highest-conviction ideas while keeping smaller positions around the core.
>
> The line "Diversification is for people who don't know what they own" was poorly worded and not

Stock picks don't blow up accounts.

Aug 23, 2026 · 1:28 PM MST · https://x.com/Venu_7_/status/2091623577338745001

24,909 impressions **252** likes **98** bookmarks **8** reposts **12** replies

Stock picks don't blow up accounts.

Position sizing does.

You only need:
- Biggest size in high-conviction Stage 2 & CANSLIM leaders backed by strong fundamentals
- Medium size in names still developing
- Starter size in ideas still proving themselves

That's it.

Not every good stock deserves the same amount of capital.

Build your portfolio like a pyramid, not a lottery ticket drawer.

RISK, POSITION SIZING & SELLING

Whatever actually happened with Leopold, I think there's one lesson every investor and trader can take away:

Whatever actually happened with Leopold, I think there's one lesson every investor and trader can take away:

Leverage.

It doesn't matter how smart or talented you are. If you're overleveraged, the market can force you out before your investment has time to work.

Building a fund from millions to billions is an incredible achievement. Unfortunately, leverage can erase years of hard work in a matter of days.

In this game, survival is everything.

RISK, POSITION SIZING & SELLING

If I had to give one piece of advice to anyone who's new to investing or trading and even to experienced investors it…

Jul 22, 2026 · 8:50 AM MST · https://x.com/Venu_7_/status/2079957373813453309

27,312 impressions **289** likes **63** bookmarks **15** reposts **30** replies

If I had to give one piece of advice to anyone who's new to investing or trading and even to experienced investors it would be this:

Increase your time horizon.

Trust me.

When I first started, I was buying and selling nonstop. Looking back, it wasn't investing or trading it was just gambling.

Over time, I realized my entire approach was wrong.

I spent years improving my technical analysis, fundamental analysis, and developing a deep understanding of semiconductors, hardware, and AI infrastructure.

Heading into this year, my goal was simple: find multibaggers. (which I did)

To make that happen, I refined my framework over and over again until it finally started working.

But one piece was still missing:

Time.

I stopped asking, "How much can I make this week?"

Instead, I started asking, "What if I held this for 6 months? 1 year? Even 3 years?"

That shift changed everything.

There's nothing wrong with short-term trading if that's your style. But if your goal is to achieve outsized returns, you need to identify the right leaders and give them enough time for the thesis to play out.

Holding names like Micron, Nebius & Tesla for months & years has taught me that patience is often just as important as stock selection.

Recent pullbacks will always test your conviction. That's part of the game.

Every year, try to increase your time horizon just a little more.

You may not master it immediately, but if you keep improving your process, you'll eventually get there.

RISK, POSITION SIZING & SELLING

If you’re pumping penny stocks and telling people to full-port into them, you’re playing with other people’s financial…

Jun 4, 2026 · 8:35 PM MST · https://x.com/Venu_7_/status/2062739983329538519

27,653 impressions **286** likes **19** bookmarks **11** reposts **22** replies

If you’re pumping penny stocks and telling people to full-port into them, you’re playing with other people’s financial futures.

If you have reach, act responsibly. Don’t use your audience as exit liquidity. Don’t promise people you’ll make them rich. Don’t convince them that one stock is the answer to all their problems.

One of the biggest red flags on FinX:

- “Full port this.”
- “Trust me, I’ll make you a millionaire - you need to listen to me.” (Ahem ahem)
- “Just follow my alerts.”

That’s not investing or trading. That’s selling hope to inexperienced people.

To anyone who started investing or trading in the last year:

- Be extremely careful with penny stocks.
- Avoid anyone telling you to go all-in on a single idea.
- Be skeptical of anyone promising wealth if you simply follow them.

The best investors and traders I’ve met don’t sell dreams.

They teach process, risk management, position sizing, patience, discipline, and how to survive long enough to compound wealth.

Real educators don’t create followers.

They create independent thinkers.

RISK, POSITION SIZING & SELLING

$RKLB is one of the best examples of why you should never sell your winners too early.

Want the secret to holding winners?

Pull up the **$RKLB** chart and study how the stock respected the 200-day SMA multiple times during the uptrend.

April 2025: $14
Nov 2025: $37
March 2026: $56

Every touch of the 200-day SMA was a dip-buy opportunity.

True leaders rarely lose the 200-day SMA during strong Stage 2 uptrends - that's usually your tell.

The number one advice I'd give anyone:

Stay away from 0DTEs and weekly options.

If you're new, those 1000% gain posts are bait - I fell for it early too.

The best traders I know use longer-dated setups and strict risk control. Even short-term trades have a process.

Start small. Stick to shares. Compounding beats chasing.

The goal isn't to get rich in a year - it's to stay in the game long enough to win.

> Thread reply 1/1 · link
>
> Survival is everything - if you last long enough, you'll find a way to win.
>
> Always remember that.

RISK, POSITION SIZING & SELLING

Welp, $SLV ran another +40% after I sold 🤣

Markets don’t pay you for predictions.

They pay you for risk management and position sizing.

This isn’t about being right or wrong.

It’s about staying in the game long term and compounding.

Figure that out early - everything changes.

RISK, POSITION SIZING & SELLING

I’ll give you one solid reason why short-term thinking and options are not worth it.

Dec 10, 2025 · 9:10 PM MST · https://x.com/Venu_7_/status/1998968583729377603

11,970 impressions **138** likes **35** bookmarks **8** reposts **14** replies

I’ll give you one solid reason why short-term thinking and options are not worth it.

The Fed cuts rates by 0.25%, IWM breaks out to multi-year highs, some starts chanting “Santa rally,” and some chase blindly. Then Oracle reports after hours and just like that, tomorrow can swing red. If you’re stuck in short-dated options, this kind of volatility doesn’t just hurt - it wipes you out.

The better approach is simple: follow the trend. If the index is above 200 day moving average, buy dips in the uptrend and ignore the noise.

The moment you stop reacting to every daily fluctuation and start thinking in weeks, months, and quarters is the moment your results actually improve.

RISK, POSITION SIZING & SELLING

Legendary Investor Peter Lynch's portfolio had multiple drawdowns, some of them large.

Nov 21, 2025 · 9:50 AM MST · https://x.com/Venu_7_/status/1991911988474380305

6,010 impressions **55** likes **16** bookmarks **2** reposts **4** replies

Legendary Investor Peter Lynch's portfolio had multiple drawdowns, some of them large.

His success wasn't because he avoided drawdowns - it was because he sat through them* and kept buying great companies.

Key points:

– During the 1981–1982 recession, Magellan dropped double-digits while inflation and rates crushed equities.
– In the 1987 crash, Magellan fell sharply along with the market (the S&P dropped 33% in weeks). Lynch's fund also took a meaningful hit but recovered rapidly because he never de-risked at the bottom.
– Lynch openly said he had "10–20% drops regularly" and investors constantly complained even while he was compounding at 29% CAGR.
– His biggest message: even the best portfolios will suffer deep but temporary declines.

His own quote:

"Everyone has the brainpower to make money in stocks. Not everyone has the stomach for the declines."

"You will have declines. If you can't handle a drop of 20–30%, you shouldn't be in stocks."

Bottom line:

Lynch's portfolio had major drawdowns - he just didn't fear them. That's why he won.

RISK, POSITION SIZING & SELLING

my best advice to become a profitable investor or trader:

my best advice to become a profitable investor or trader:

- Master position sizing - it's the foundation of risk management
- Protect your capital before chasing returns
- Read "How to Make Money in Stocks" by William O'Neil
- Stay away from options, especially weeklies & 0DTEs
- Find a good mentor early
- Review 50+ charts daily until patterns click instantly
- Learn the basics of fundamentals
- Blend fundamentals with technicals that's where the edge is
- Never chase, never FOMO
- Buy dips in uptrends, not in downtrends
- Remember: cheap usually gets cheaper, expensive often gets more expensive
- Always listen to the bear case on your picks
- Stay humble the market humbles everyone eventually
- Be kind & help others without expecting anything in return; it always comes back to you

25,928 impressions **163** likes **127** bookmarks **11** reposts **21** replies

If you're new to investing or swing trading, my best advice is: never go all-in on one stock.

70% of returns come from position sizing. Here's how I size my portfolio:

I usually hold no more than 12-13 stocks at a time, but most of my returns come from my top 5.

My top 5 stocks are usually mega caps or safe havens. I don't size more than 15% into a single name, and together they make up about 50% of the portfolio.

My bottom 7-8 stocks are small caps and growth names. I don't size more than 5% into a single name, and together they make up about 30% of the portfolio.

The remaining 20% is usually kept in cash.

This approach helped me generate +180% returns with shares only this year with a six-figure portfolio.

Sizing, sizing, sizing matters!

One of the most common mistakes investors and traders make is buying stocks solely because insiders are buying.

Insider buying shows conviction. It doesn't mean they nailed the bottom.

$TTD CEO bought $148M around $23-$25. Stock is now $12.

$PANW CEO bought $10M around $147. Stock is now $400(+185%) and absolutely nailed it.

I can show you 100+ examples where insider buying worked and another 100 where it went terribly wrong.

Insider buying is one data point, not a thesis.

Technicals + Fundamentals + Insider activity. Build your own thesis. Never blindly follow anyone.

Oct 1, 2026 · 9:49 PM MST · https://x.com/Venu_7_/status/2105882724481548457

15,403 impressions **164** likes **52** bookmarks **18** reposts **16** replies

One of the biggest mistakes investors make is assuming a stock near its lows is “cheap” while a stock near its highs is “expensive.”

William O’Neil explained this perfectly:

“What seems too high usually goes higher and what seems too low usually goes lower.”

There’s a reason stocks near 52-week highs deserve attention. Consistently making new highs can signal strong relative strength, institutional accumulation, improving fundamentals and demand overwhelming supply.

Meanwhile, stocks making new lows often look attractive simply because they’re down 40%, 50% or 70%. But being down 70% doesn’t automatically make something cheap. Cheap can always get cheaper when the fundamentals and technical structure are deteriorating.

Another misconception is that a new ATH means the opportunity is already gone. A stock can spend months building a massive base, digesting its previous move and allowing earnings to catch up. When it finally breaks into new highs, that can actually be the beginning of the next major move, not the end.

Many of the greatest winners didn’t make one new high and stop. They made new highs, consolidated, built another base and continued higher as earnings and institutional demand followed.

None of this means blindly buying every stock at ATHs. There’s a massive difference between chasing an extended stock and buying a strong company breaking out of a proper base with explosive earnings growth + institutional accumulation.

New highs ≠ automatically expensive.
New lows ≠ automatically cheap.

Sometimes stocks make new highs for a reason, and sometimes they make new lows for a reason.

The market has a habit of rewarding strength and punishing weakness far longer than most people expect.

FUNDAMENTALS & CANSLIM

Want to find potential market leaders BEFORE their major moves? Study CAN SLIM.

Sep 29, 2026 · 12:01 AM MST · https://x.com/Venu_7_/status/2104829007103480029

13,523 impressions **150** likes **135** bookmarks **17** reposts **9** replies

Want to find potential market leaders BEFORE their major moves? Study CAN SLIM.

CAN SLIM is one of my favorite frameworks for finding potential market leaders, introduced by legendary William O'Neil.

C - Current earnings growth
A - Annual earnings growth
N - New products, catalysts or new highs
S - Supply + demand
L - Leaders, not laggards
I - Institutional sponsorship
M - Market direction

I spent some time screening AI + Tech names using this framework, while also looking for strong relative strength + stocks still building bases rather than chasing extended breakouts.

A few names on my radar:
$NVDA $ANET $PLTR $CRWD $MU
$RBRK $NET $FTNT $PANW $LITE
$SMTC $AMD $CLS $NOW $SNOW
$DDOG $CRDO $FORM $HPE $COHU
$VICR $FPS $IMOS $ASML $TSM

Not every name will check every CAN SLIM box at the same time - and even the best company can be a bad entry if you're chasing it after a major move.

The real edge is finding companies where earnings are accelerating + relative strength is improving + institutions are accumulating while the stock is still building a healthy base. That's when I want the name on my radar

Fundamentals tell me WHAT to own. Technicals tell me WHEN to build the position.

CANSLIM

the 7-point checklist behind every monster stock

C - current quarterly earnings up 25%+. ☑

A - annual earnings growing 25%+. ☑

N - new product, new service, new highs. ☑

S - supply & demand: tight float, big volume. ☑

L - leader in a leading group. ☑

I - institutions accumulating. ☑

M - market in a confirmed uptrend. ☑

Fundamentals help me decide what deserves my money.

Technicals help me decide when to put it to work.

A growing business emerging from a well-built base is where those two approaches come together.

That's the combination I keep looking for.

FUNDAMENTALS & CANSLIM

Want to know how to find future market leaders before they become obvious?

Aug 27, 2026 · 3:06 PM MST · https://x.com/Venu_7_/status/2093097806164815925

16,872 impressions **227** likes **220** bookmarks **16** reposts **12** replies

Want to know how to find future market leaders before they become obvious?

I start with one fundamental metric:

Earnings Per Share (EPS).

Always pay close attention to earnings every quarter.

Not just whether they beat earnings the pattern behind the earnings.

There are 3 things I look for every quarter:

1. EPS beat vs estimates

I want to see companies consistently beating expectations.

It tells me the business is executing better than what the market expected.

2. YoY EPS growth

I generally look for 25%+ EPS growth YoY, and ideally I want to see that growth accelerating quarter over quarter.

Many of the biggest market leaders show strong earnings acceleration before their biggest moves.

3. Forward EPS revisions

This is one of the most important and often overlooked.

After earnings, are analysts raising EPS estimates for the next quarter and full year?

When forward earnings expectations continue moving higher, institutions have another reason to keep accumulating the stock.

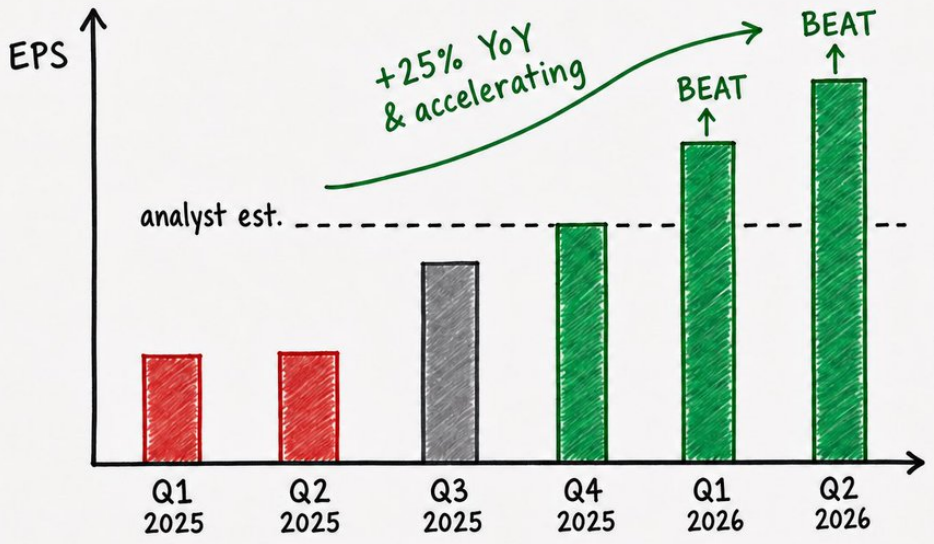

Beat + Growth + Raise.

Combine that with strong revenue growth, improving margins, a strong theme and Stage 2 price action and you have the characteristics I look for in potential market leaders.

Earnings are what move stocks over the long term.

EARNINGS POWER

the #1 signal for future market leaders

3 CHECKS

- beat estimate
- +25% YoY growth
- forward EPS raised

Beat + Grow + Raise = future leader.

FUNDAMENTALS & CANSLIM

The Rule of 40 - The Quality Test for Software Businesses

Aug 3, 2026 · 1:52 PM MST · https://x.com/Venu_7_/status/2084382034487837124

13,566 impressions **169** likes **104** bookmarks **18** reposts **9** replies

The Rule of 40 - The Quality Test for Software Businesses

One formula: Revenue Growth % + FCF Margin %

Above 40% = high-quality software business.

Why it works: It rewards companies that can grow profitably, not just grow at any cost. The formula doesn't care how you get there - only that the combination of growth and profitability is strong.

Simple example:
- Revenue growth: 28%
- FCF margin: 15%
- Rule of 40 = 28 + 15 = 43% -> pass

Now look at **$PLTR**'s Q2:
- Revenue growth: +93% YoY
- FCF margin: 62%
- Rule of 40 = 155%

That's not passing the test. That's lapping it - nearly 4x the bar.

Most software companies fight to stay above 40. The rare ones compound growth AND cash generation at the same time. That's what the formula is built to find.

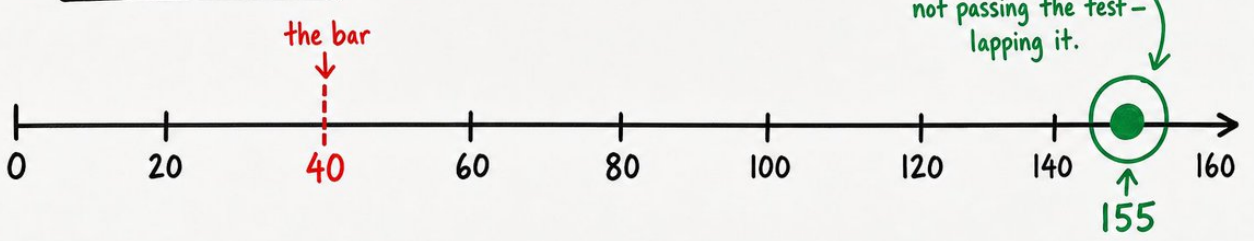

THE RULE OF 40

the quality test for software businesses

Revenue Growth % + FCF Margin %

above 40% = high-quality business

EXAMPLE:
28% growth + 15% FCF margin
= 43%
✓ PASS

@Venu_7_

FUNDAMENTALS & CANSLIM

You want to know why we need a little knowledge of fundamentals, even though most of us are primarily technical traders?

Jul 20, 2026 · 9:14 AM MST · https://x.com/Venu_7_/status/2079238441343316169

14,930 impressions **144** likes **97** bookmarks **7** reposts **13** replies

You want to know why we need a little knowledge of fundamentals, even though most of us are primarily technical traders?

You'll find hundreds of stocks with great-looking charts. The problem isn't finding setups - it's choosing the right ones.

That's where fundamentals come in.

Fundamentals help you filter and narrow down your watchlist before you even start analyzing charts.

look for things like:
- Revenue growth above 20% YoY
- EPS growth above 20% YoY
- Expanding margins
- Strong guidance
- Industry leaders with large TAMs

Once I have that shortlist, technicals tell me when to buy, while fundamentals tell me what to buy.

I don't think you need to become a CFA or read 200-page annual reports. Just understanding a few key metrics can dramatically improve your stock selection.

Technicals help with timing. Fundamentals help with conviction. You need both to consistently find the biggest winners.

FUNDAMENTALS & CANSLIM

One of the biggest lessons I've learned:

Jul 20, 2026 · 6:00 AM MST · https://x.com/Venu_7_/status/2079189581581176966

23,753 impressions **226** likes **101** bookmarks **11** reposts **9** replies

One of the biggest lessons I've learned:

Stock prices eventually follow earnings.

In the short term, stocks can move on sentiment, news, macro events, or valuation expansion.

But over the long term, EPS growth is one of the biggest drivers of stock performance.

That's why I spend far more time studying future earnings estimates than trying to predict the next CPI print, Fed meeting, or headline.

If a company's earnings per share doubles, triples, or compounds over several years, its intrinsic value generally increases as well. While valuation multiples can expand or contract, earnings growth remains the foundation of long-term returns.

That's also why I rarely chase "cheap" stocks based solely on low P/E ratios.

I'd rather own companies with rapidly growing earnings, expanding margins, and strong revenue growth than businesses with low valuations but little or no growth.

Of course, analyst estimates aren't guarantees. They change as new information becomes available, and not every company will meet expectations.

But consistently following forward EPS estimates helps you identify where institutions believe the strongest earnings growth is likely to occur.

Over the long run, earnings are the engine. Stock price is simply the reflection of that engine.

FUNDAMENTALS & CANSLIM

One thing I've noticed over the years:

Jun 26, 2026 · 8:43 AM MST · https://x.com/Venu_7_/status/2070533397269864723

22,138 impressions **231** likes **70** bookmarks **9** reposts **22** replies

One thing I've noticed over the years:

A stock can have the perfect technical breakout, but if it lacks fundamental strength, the move often fades.

That's why I prefer companies growing revenue and EPS at 15-20%+ YoY.

Strong technicals attract buyers.

Strong fundamentals keep them there.

FUNDAMENTALS & CANSLIM

CANSLIM Top 20 leaders are all showing the same characteristics:

Jun 11, 2026 · 10:55 AM MST · https://x.com/Venu_7_/status/2065130693542179283

- Explosive EPS growth
- Strong revenue growth
- Exceptional relative strength
- Trading near 52-week highs

Current CANSLIM Top 20 leaders:

$CRDO $LPG $RSI $VVX $LLY $VCYT $KRYS $ARW $COCO $TTMI $NBIX $LINC $INCY $DAVE $VIRT $EVR $CUBI $ATLC $TKO $LRCX

FUNDAMENTALS & CANSLIM

If you want to understand how growth stocks trade, study the $DUOL case.

May 4, 2026 · 2:10 PM MST · https://x.com/Venu_7_/status/2051409162081599868

17,025 impressions **140** likes **25** bookmarks **7** reposts **13** replies

If you want to understand how growth stocks trade, study the **$DUOL** case.

$DUOL down -13% and -82% from ATH's despite a strong earnings beat.

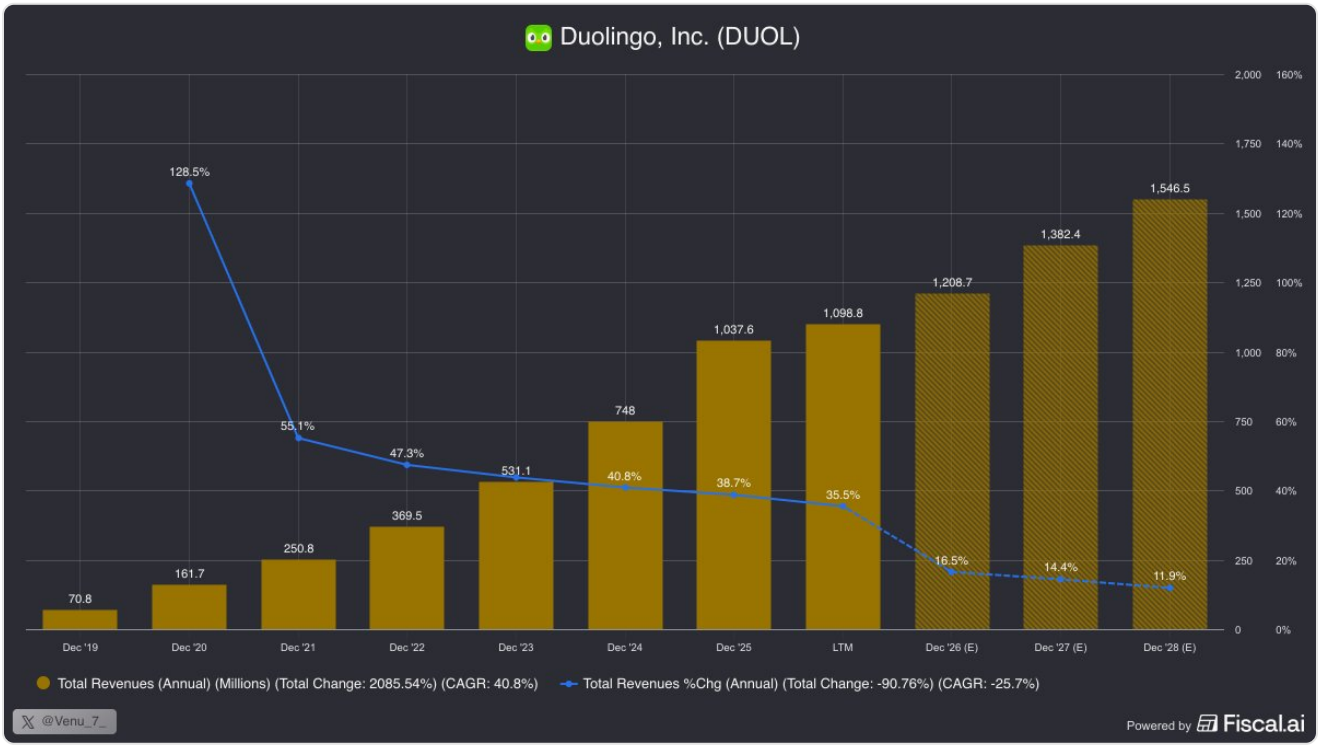

You might wonder why?

Revenue is still growing, but the growth rate is slowing fast:

2021: 55%
2022: 47%
2023: 40%
2024: 38%
2025: 35%
2026E: 16%
2027E: 14%
2028E: 12%

For growth stocks, the direction of growth matters more than the headline beat.

When growth decelerates, the market compresses the multiple - even if the company is still executing.

FUNDAMENTALS & CANSLIM

I’ll probably get attacked for sharing this, but it proves an important point:

Feb 19, 2026 · 7:06 PM MST · https://x.com/Venu_7_/status/2024666889461649488

15,059 impressions **79** likes **16** bookmarks **3** reposts **18** replies

I’ll probably get attacked for sharing this, but it proves an important point:

Duolingo is a perfect example of why revenue growth direction matters.

Revenue grew 40%
Now expected to grow 20% over the next couple of years.

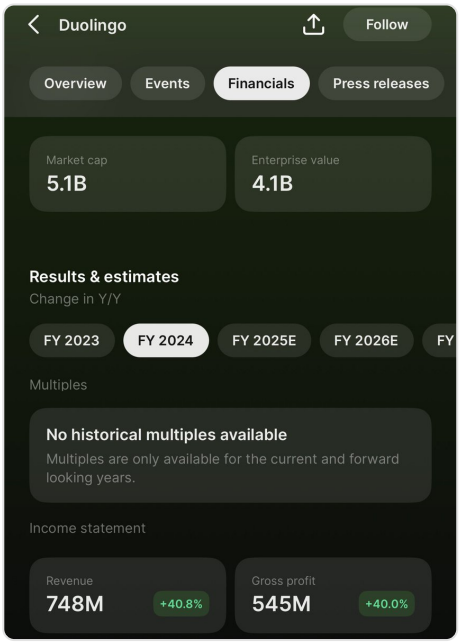

Yes, revenue is still growing.

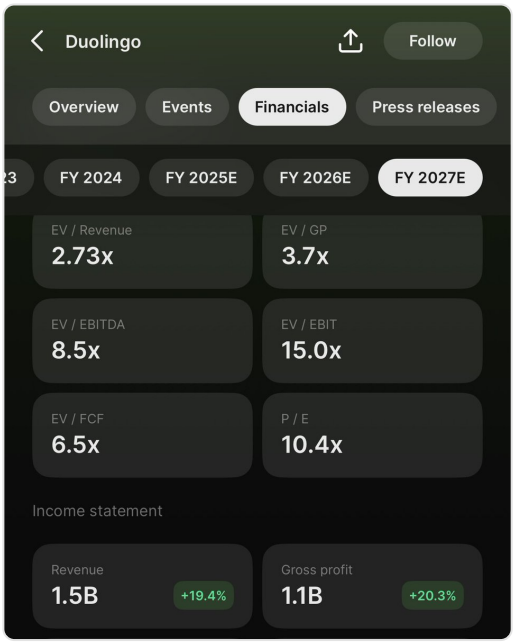

But the growth rate is slowing.

And that’s what the market reacts to.

Not just growth but the change in growth.

This is how stocks quietly top while the numbers still look “strong.”

Quotes post: x.com/i/status/2024663690411462891

FUNDAMENTALS & CANSLIM

One thing I always tell anyone learning fundamentals:

Feb 19, 2026 · 6:53 PM MST · https://x.com/Venu_7_/status/2024663690411462891

21,209 impressions **125** likes **31** bookmarks **3** reposts **8** replies

One thing I always tell anyone learning fundamentals:

The market looks ahead, not behind.

It doesn't matter how great the past earnings or growth were. If future growth is slowing, the stock will get punished.

This is where many get trapped. They see strong historical numbers and assume it's undervalued, without realizing the growth story is fading.

Stocks move based on where the business is going, not where it's been.

Train yourself to focus on future growth early. It will save you a lot of money.

FUNDAMENTALS & CANSLIM

my advice to anyone who recently started doing fundamental analysis:

Dec 18, 2025 · 9:59 AM MST · https://x.com/Venu_7_/status/2001698901112557827

7,455 impressions **58** likes **32** bookmarks **0** reposts **8** replies

my advice to anyone who recently started doing fundamental analysis:

don't just look at past growth, pretty numbers, and say a stock is "undervalued" because it's making 52-week lows.

the market is always forward-looking. that's what actually matters. you must understand where the business is going and, more importantly, what can go wrong before you buy.

few things to keep in mind:

- sustainable revenue growth
- eps, net income, and free cash flow staying positive
- healthy balance sheet with manageable debt and solid cash
- who the real competitors are and how brutal that space is

because if you blindly go by numbers, you end up buying stories like **$NOK** or **$BB** back in the day. blockbuster looked like the leader in movies, while **$NFLX** was a tiny business in 2010. we all know how that ended. apple didn't just compete it wiped out nokia and blackberry.

point is: understand the business deeply and respect the risks.

FUNDAMENTALS & CANSLIM

I get this question a lot, so here's the simple version.

Nov 2, 2025 · 9:04 AM MST · https://x.com/Venu_7_/status/1985015055306670277

10,042 impressions **88** likes **61** bookmarks **6** reposts **5** replies

I get this question a lot, so here's the simple version.

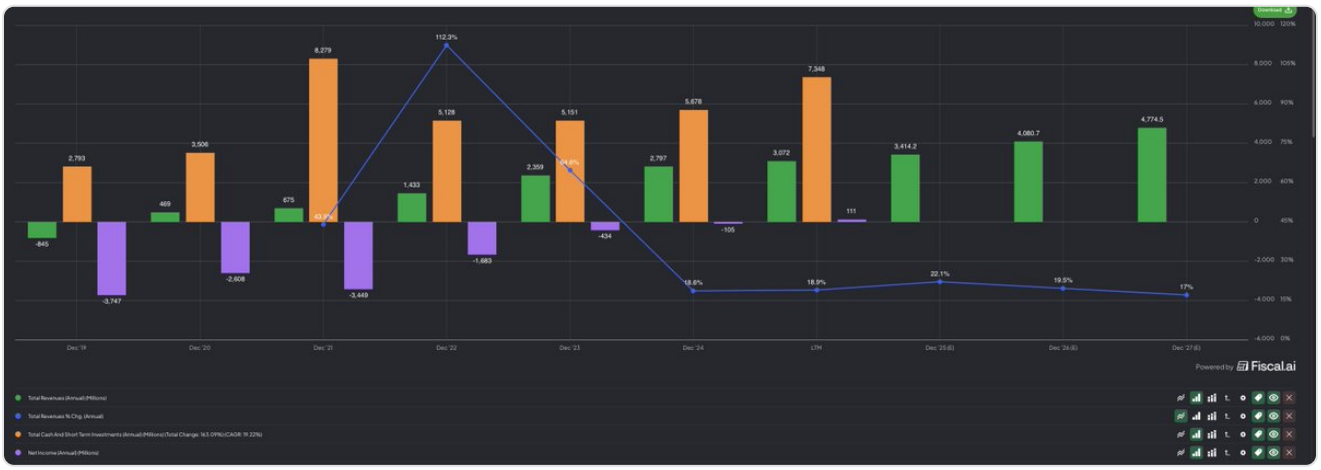

I'm not as strong in fundamentals as I am in technicals, but there are a few key metrics I always check before buying a stock:

- Revenue growth YoY above 15% (and forward estimates matter too)
- Net income positive + consistent free cash flow
- Strong balance sheet - low debt, high cash/equity
- Compare with industry standards to confirm quality

One stock that checks all these boxes right now is **$GRAB**

revenue growing 15%+ YoY (with solid future estimates), net income just turned positive, and $7B in cash on the balance sheet (about 25% of its market cap).

I don't rely much on P/E ratios - they rarely tell the full story for growth names.

FUNDAMENTALS & CANSLIM

Technicals show when to buy,

Oct 26, 2025 · 9:50 PM MST · https://x.com/Venu_7_/status/1982671098706821407

If you're just starting out in investing or trading, it's important to learn both fundamentals and technicals — they complement each other and can significantly boost your success.

Fundamentals help you evaluate a company's valuation, competitive edge (moat), long-term outlook, and whether you're buying at the right price.

Technicals guide you on the best entry points, when to add to your position, and how long to ride the trend.

Some may argue that one is better than the other, but in my experience, both play a vital role. Combining them gives you a well-rounded edge — regardless of your strategy.

One thing I've learned in the markets is that staying in the game matters more than anything else!

Recent selloffs may push quite a few people to quit the market, but it's important to remember how rewarding the April-September 2025 and April-June 2026 runs were.

Markets go through cycles, and there will always be more opportunities in the coming months and years. Until then, keep doing your homework and focus on making fewer mistakes.

Markets will always give you another opportunity, but only if you survive the difficult periods!

MINDSET & DISCIPLINE

The best advice I can give during market drawdowns like these:

23,616 impressions **157** likes **16** bookmarks **5** reposts **10** replies

The best advice I can give during market drawdowns like these:

Stick to your own rules and framework.

Remember how you navigated similar periods in the past, what worked, what didn't, and the lessons you learned along the way.

Just because the market suddenly starts selling off doesn't mean you should abandon a framework you've spent years building that has consistently delivered results.

And remember, some of the same people who are bearish today will turn bullish the moment the market starts moving higher. There's absolutely nothing wrong with changing your outlook as conditions change.

But just because someone is bearish doesn't mean you should blindly sell your positions. And just because someone is bullish doesn't mean you should blindly buy.

Listen to different perspectives, evaluate the facts, manage your risk, and make your own decisions.

Never let someone else's conviction override your own discipline.

At the end of the day, it's your portfolio, your money, and your responsibility. Not theirs.

MINDSET & DISCIPLINE

October 2023, April 2024, August 2024, April 2025, November 2025, March 2026, June 2026, and now October 2026.

Oct 14, 2026 · 12:25 PM MST · https://x.com/Venu_7_/status/2110452065319448962

16,920 impressions **217** likes **36** bookmarks **4** reposts **9** replies

October 2023, April 2024, August 2024, April 2025, November 2025, March 2026, June 2026, and now October 2026.

Different months. Different catalysts. But the SAME fear and uncertainty!

One thing I've learned over the years is that the stock market will test your patience, conviction, and discipline far more often than you expect.

During every correction, it feels like nothing is working, growth stocks are getting destroyed, and the market will never recover.

Yet history has shown us that some of the BEST opportunities emerge during the most uncomfortable periods.

I'm not saying the worst is behind us or that every stock will recover. But I'm certainly not going to abandon an investment/trading framework I've spent years building because of a few difficult weeks.

It's EASY to be optimistic when everything is going up. The REAL challenge is staying rational when your portfolio is taking a hit and fear is everywhere.

You don't need to predict every market move. You need to survive the difficult periods and stay disciplined enough to participate when the next window of opportunity opens.

Stay optimistic, folks! Better days will come! ❤️

MINDSET & DISCIPLINE

One of the biggest mistakes traders and investors make is abandoning a proven, profitable approach simply because the…

One of the biggest mistakes traders and investors make is abandoning a proven, profitable approach simply because the market stops rewarding it temporarily.

Markets go through rallies, corrections, consolidations, and periods where nothing seems to work.

Even the best strategies go through difficult periods.

If you've spent years developing a process that consistently works, why would you abandon it because of a few frustrating months?

The key is knowing when to be aggressive, when to reduce exposure, and when to simply sit tight.

Adapt to market conditions, but don't abandon your edge.

When the market finds its rhythm again, you want to be ready to capitalize on the next window of opportunity, not starting from scratch with a completely different strategy.

You don't need a new strategy every time the market changes. You need the discipline to execute a proven one when the conditions are right.

MINDSET & DISCIPLINE

One of the biggest reasons traders and investors lose patience is simple: they're looking at too small of a timeframe.

Oct 7, 2026 · 8:28 AM MST · https://x.com/Venu_7_/status/2107855544275067381

12,726 impressions **150** likes **45** bookmarks **6** reposts **7** replies

One of the biggest reasons traders and investors lose patience is simple: they're looking at too small of a timeframe.

You can spend 4-6 months consolidating, feeling like nothing is working, then make some of your best returns in just 1-2 months when the market runs hot.

Returns aren't linear.

The boring periods are where people start forcing trades, chasing stocks and abandoning their process.

Sometimes the biggest edge is simply staying disciplined long enough to be there when the next window of opportunity opens.

Think in bigger timeframes. Patience feels useless until suddenly it pays you.

MINDSET & DISCIPLINE

5 years in the market might not sound like much, but I've spent a lot of that time studying past corrections, bear…

Oct 1, 2026 · 1:24 PM MST · https://x.com/Venu_7_/status/2105755677209882949

17,734 impressions **194** likes **23** bookmarks **6** reposts **18** replies

5 years in the market might not sound like much, but I've spent a lot of that time studying past corrections, bear markets and what actually caused them.

Just look at the last few years:

2023 - Banking crisis
2024 - April correction + Yen carry trade unwind
2025 - Tariff bear market
2026 - War, oil, inflation + higher yields

Yet through all of this, **$SPY** and **$QQQ** kept recovering, making new ATHs and delivering enormous returns.

My point is simple: There will ALWAYS be a reason not to invest.

I'm not saying ignore yields or macro risks. I pay attention to all of them. But I'm also not going to let one macro factor override what technicals + fundamentals are actually telling me.

Even through all these problems, companies like **$NVDA** and **$MU** continued printing massive earnings growth because AI demand didn't suddenly disappear because of a scary headline.

That's why I'd rather spend my time finding companies with explosive earnings growth + strong technical structures than trying to predict the next crash every few months.

And remember - X rewards engagement. Being loud about the next crash can generate a lot of views, but views don't equal portfolio performance.

For me, I'll stay invested until my framework gives me a reason not to. If the market starts telling me something has changed, I'll adjust accordingly. So far, that hasn't happened.

The next leaders are being built while everyone else is distracted. Do the work now, so you're ready when the opportunity comes.

MINDSET & DISCIPLINE

There are no shortcuts in life, trading, or investing.

Sep 15, 2026 · 9:32 AM MST · https://x.com/Venu_7_/status/2099899194496741568

11,258 impressions **141** likes **21** bookmarks **2** reposts **9** replies

There are no shortcuts in life, trading, or investing.

There is no such thing as quick money. Always remember: what comes fast can disappear just as fast.

Build a system. Put in the work. Fine-tune it to your own risk appetite, personality, and framework.

You will make mistakes. You will take losses. The goal isn't to avoid them - it's to learn from them without letting them take you out of the game.

Don't compare your journey to someone else's results. Focus on getting a little better every day.

And if you put your heart and soul into something you genuinely love, stay humble enough to keep learning, and stay consistent long enough - you'll make it.

MINDSET & DISCIPLINE

The biggest edge in the market right now isn't technicals or fundamentals.

Sep 11, 2026 · 9:58 AM MST · https://x.com/Venu_7_/status/2098456211977130229 · 🧵 thread

15,746 impressions **222** likes **49** bookmarks **9** reposts **25** replies

The biggest edge in the market right now isn't technicals or fundamentals.

Most people can learn both.

The real edge is something much harder to master:

Discipline + Patience.

I see so many people expecting instant profits. A stock does nothing for a few weeks or months, and suddenly they're questioning the thesis or chasing whatever is moving that day.

Many great traders and investors spent years developing their process. Why should we expect to master it overnight?

The harder skill is having the discipline to follow your process and the patience to let a good thesis actually play out.

And patience doesn't mean buying a struggling turnaround and blindly holding it for 10 years.

For me, it means finding profitable businesses growing 20%+ with strong fundamentals, strong technicals and powerful themes then giving those businesses enough time to compound while the thesis remains intact.

Learn the fundamentals. Learn the technicals.

But master patience + discipline.

That's where the real edge is.

MINDSET & DISCIPLINE

The AI bull market has sent $QQQ up 165% since the start of 2023.

Sep 1, 2026 · 12:01 PM MST · https://x.com/Venu_7_/status/2094863297636127079

65,594 impressions **240** likes **86** bookmarks **21** reposts **14** replies

The AI bull market has sent **$QQQ** up 165% since the start of 2023.

Sounds easy in hindsight.

It wasn't.

The market moves in waves.

In most years, we may only get 2-3 strong windows where a large portion of the returns are made. The rest of the time can be spent correcting, consolidating or chopping around for months.

Look at April 2025. Look at March 2026.

If you wanted to avoid every uncomfortable period, you risked missing some of the strongest moves that followed.

This is why I don't get discouraged during 3-6 month consolidations.

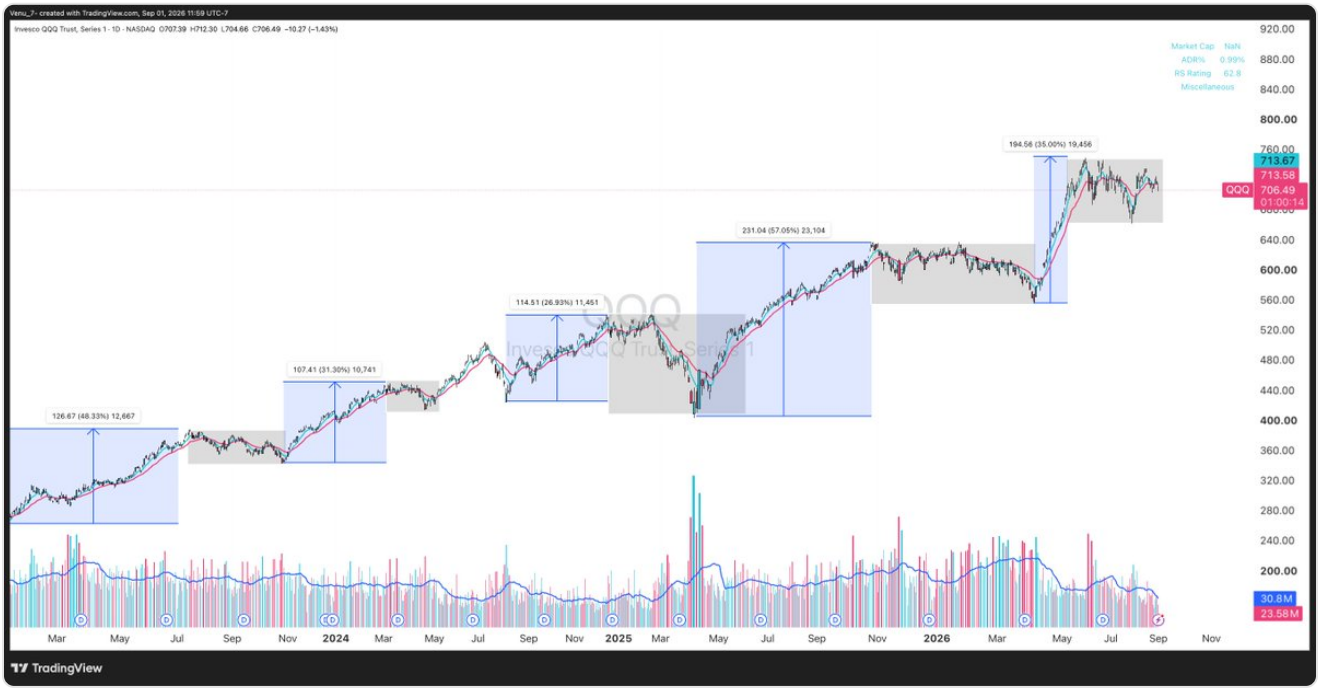

That's preparation time.

Build the watchlist. Study earnings. Find the strongest themes. Identify the next leaders.

When the market expands, execute.

When the market consolidates, prepare.

Volatility is the price we pay for outsized returns.

MINDSET & DISCIPLINE

Market corrections reveal your strengths and weaknesses as an investor/ trader.

Jul 28, 2026 · 8:24 AM MST · https://x.com/Venu_7_/status/2082125019417887161

12,534 impressions **134** likes **19** bookmarks **7** reposts **9** replies

Market corrections reveal your strengths and weaknesses as an investor/trader.

Learn from the mistakes you made during previous pullbacks, refine your process, and make sure you come out of this correction better than the last one.

Every correction teaches a lesson. The ones who survive and learn are usually the ones who outperform in the next cycle.

MINDSET & DISCIPLINE

Since the AI bull market began in 2023, Nasdaq $QQQ has gone through several major pullbacks and corrections:

Jul 27, 2026 · 10:31 AM MST · https://x.com/Venu_7_/status/2081794721584968184

20,808 impressions **87** likes **18** bookmarks **7** reposts **15** replies

Since the AI bull market began in 2023, Nasdaq **$QQQ** has gone through several major pullbacks and corrections:

October 2023 - Higher-for-longer rates (-12% from ATHs)
August 2024 - Yen carry trade unwind (-16% from ATHs)
April 2025 - Tariffs (-26% from ATHs)
March 2026 - Iran war (-12% from ATHs)
July 2026 - Current correction (-10% from ATHs)

Following the four completed corrections, QQQ gained roughly 15% over the next 8 weeks, on average.

The lesson?

Corrections are part of every bull market, and they often create the biggest opportunities.

On top of that, history also shows that when the VIX spikes into the 25-30 range, forward S&P 500 returns have generally skewed positive over the following months. (**$VIX** is currently ay 20)

Go back and study how sharp the rallies were once those corrections were over. We've seen this happen time and time again.

One of the most famous investing anecdotes is that Fidelity's best-performing accounts belonged to investors who had either forgotten about their accounts or had passed away.

There's a big lesson in that.

MINDSET & DISCIPLINE

One of the biggest lessons I've learned:

Jul 13, 2026 · 5:10 PM MST · https://x.com/Venu_7_/status/2076821580681011313

23,312 impressions **205** likes **88** bookmarks **16** reposts **18** replies

One of the biggest lessons I've learned:

Every major drawdown feels like this is it.

October 2023.
April 2024.
August 2024.
April 2025.
March 2026.

Every single one felt different while you were living through it. The headlines got louder, fear spread everywhere, and it became easy to convince yourself that another 2000 or 2008 had arrived.

But here's what I've noticed:

Corrections and bear markets are not the same thing.

A correction is often driven by sentiment, positioning, or macro uncertainty.

A true bear market is usually accompanied by a sustained deterioration in fundamentals:

- Earnings growth slows or turns negative.
- Companies begin cutting CapEx.
- Market leadership narrows and breaks down.
- Major indexes form persistent lower highs and lower lows.

That's why I spend far more time studying earnings reports than financial headlines.

The market can ignore fear.

It struggles to ignore deteriorating earnings.

Could we eventually see another prolonged bear market in next 3 or 4 years? Yes.

But until I see meaningful evidence that corporate earnings, CapEx spending, and institutional leadership are breaking down, I treat sharp pullbacks as part of a bull market - not a reason to abandon my process.

The biggest gains I've ever made came after periods that felt the most uncomfortable.

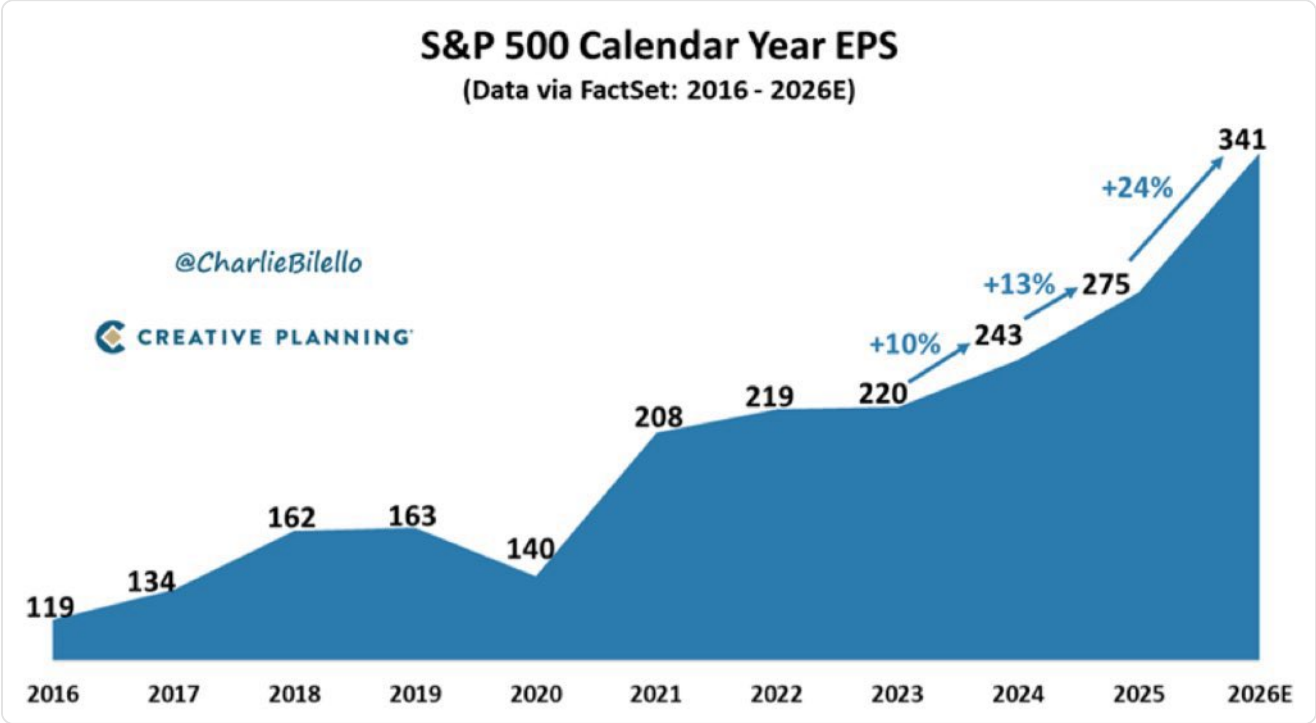

Staying invested doesn't mean ignoring risk.

It means knowing the difference between temporary volatility and a genuine change in trend.

That's a distinction every investor/trader should learn.

Separate fear from facts, and you'll separate yourself from the crowd.

One of the most underrated skills in investing is staying calm when everyone else is emotional.

Fundamentals can be learned.

Technicals can be learned.

The real edge is staying disciplined when fear takes over.

The market tests your psychology more than your intelligence.

MINDSET & DISCIPLINE

One of the biggest mistakes investors & traders make is treating every price move as a signal to act.

Jun 23, 2026 · 10:36 AM MST · https://x.com/Venu_7_/status/2069474746765627520

16,686 impressions **165** likes **21** bookmarks **7** reposts **7** replies

One of the biggest mistakes investors & traders make is treating every price move as a signal to act.

Before every buy or sell, write down your reason.

The market rewards good decisions, not constant activity.

Less is more. The best portfolios are often the ones that are managed the least and reviewed the most.

MINDSET & DISCIPLINE

I’m genuinely curious why so many people on X don’t have a longer time horizon.

May 6, 2026 · 4:29 PM MST · https://x.com/Venu_7_/status/2052168896447226190

23,551 impressions **361** likes **124** bookmarks **26** reposts **29** replies

I’m genuinely curious why so many people on X don’t have a longer time horizon.

guys, you’ll make a lot of money by holding the right companies - ones with strong EPS/revenue growth and solid forward estimates, especially around the AI trade.

Study William O’Neil’s book, How to Make Money in Stocks, and watch his interviews/videos.

He made a massive amount of money by buying breakouts in high-growth companies and holding them for months until he saw climax tops and real trend deterioration.

I know X rewards quick profits and instant gratification. But trust me - holding winners is one of the hardest skills in investing. If you can master it, your YTD and overall portfolio returns can improve drastically.

Have your own framework for buying and selling. Don’t sell just because someone on X says a stock is “extended.” Likewise, don’t buy just because someone else is buying it.

Focus on price action, Technicals, fundamentals & your own conviction🫡

MINDSET & DISCIPLINE

Most new investors don’t fail because of the market - they fail because of who they listen to.

Mar 23, 2026 · 11:14 PM MST · https://x.com/Venu_7_/status/2036325768587046943 · 🧵 thread

8,796 impressions **128** likes **66** bookmarks **6** reposts **6** replies

Most new investors don’t fail because of the market - they fail because of who they listen to.

- Spend less time on X, more time actually learning technicals and fundamentals.

- Focus on companies growing revenue and EPS 20%+ YoY with visibility for the next 2-3 years.

- Be careful with “value traps” like **$PYPL** people will show past growth, but ignore what future growth looks like. That’s what matters.

- Technicals aren’t complicated. Stage Analysis and CAN SLIM are enough. You don’t need fancy wave theories to make money.

- While charting, always start with Monthly and Weekly for the bigger picture and trend, then use Daily for entries.

- Buy relative strength names - stocks forming bases or already in uptrends, not broken charts hoping to bounce.

- Unfollow anyone throwing insane targets on popular retail names. That’s noise designed to trap you.

- No “furu” is coming to save your position. If it goes down, it’s on you. Know why you bought it and where you’re wrong if things change.

If you’re not disciplined with your money, it becomes very hard for any strategy or edge to work consistently. Everything else builds on that foundation.

MINDSET & DISCIPLINE

A simple framework for uncertain markets:

Mar 12, 2026 · 10:52 AM MST · https://x.com/Venu_7_/status/2032152800189440434

4,568 impressions **49** likes **9** bookmarks **3** reposts **3** replies

A simple framework for uncertain markets:

Noise: tariff headlines, oil spikes, pundit predictions, Fed speculation.

Signal: earnings revisions, institutional flows, relative strength, real capex.

Noise changes every hour. Signal changes every quarter.

If you're making weekly decisions based on hourly information, you're playing the wrong game.

MINDSET & DISCIPLINE

This is nothing tbh. I've seen multiple drawdowns and got used to it.

Mar 3, 2026 · 2:40 PM MST · https://x.com/Venu_7_/status/2028948541524373735

11,551 impressions **63** likes **6** bookmarks **0** reposts **2** replies

This is nothing tbh. I've seen multiple drawdowns and got used to it.

It took me a while, but my emotions are detached from my portfolio PnL. It's one of the hardest things to master. Once you do, you see the bigger picture.

If you know why you bought a stock and the thesis is intact, volatility is noise.

I'm not in the camp of going all cash and trying to jump back in when things "settle." I know people who missed the entire April 2025 rally doing that.

Always stay invested.

MINDSET & DISCIPLINE

When it comes to the stock market, it’s not about how smart or knowledgeable you are.

Feb 22, 2026 · 8:25 PM MST · https://x.com/Venu_7_/status/2025774037155360931

5,729 impressions **94** likes **26** bookmarks **3** reposts **3** replies

When it comes to the stock market, it’s not about how smart or knowledgeable you are.

It’s about how disciplined you are with your framework and how good you are at pattern recognition.

If I had to leave a few pieces of advice:

- Be disciplined with your money.
- Both technicals and fundamentals matter - learn how to use them properly.
- Always look at the bigger picture and think long term.
- It’s not about how much you made last year, it’s about how much you reduce your drawdowns going forward.
- Whatever looks easy usually isn’t, and whatever looks hard becomes easier with experience.
- Make mistakes, but don’t repeat the same ones.

Believe in your own process and your own skills not random strangers on the internet.

MINDSET & DISCIPLINE

Investing isn’t about how much you know.

Sep 27, 2025 · 8:20 AM MST · https://x.com/Venu_7_/status/1971958164171247952

3,122 impressions **29** likes **1** bookmarks **1** reposts **8** replies

Investing isn’t about how much you know.

It’s about the habits you build, the discipline you keep, and the edge you develop.

You get paid for discipline, not for knowledge.

Know your strengths, understand your weaknesses, and stick to your process.

MINDSET & DISCIPLINE

Most people want to make money first, but the truth is you need to get your mindset right before anything else.

Sep 2, 2025 · 7:37 PM MST · https://x.com/Venu_7_/status/1963068907457290515

3,379 impressions **34** likes **12** bookmarks **0** reposts **4** replies

Most people want to make money first, but the truth is you need to get your mindset right before anything else.

Before you buy a stock pause and ask yourself: why am I buying this?

If you can't point to clear reasons like fundamentals, technical setup, risk/reward, or even understanding what the company does then it's not a trade you should be in.

This game rewards patience, discipline, and conviction. The money follows only after the mindset is right.

What are the most important things to keep in mind when doing Technical Analysis?

Aug 30, 2026 · 8:13 AM MST · https://x.com/Venu_7_/status/2094080970047762591

17,020 impressions **210** likes **233** bookmarks **21** reposts **18** replies

What are the most important things to keep in mind when doing Technical Analysis?

Here are 6 things I always pay attention to:

1) Start with the weekly chart: Understand the trend, stage, and overall structure first. Then use the daily for entries.

2) Price comes first: Price is the final result of everything the market knows. Indicators are secondary and mostly derived from price. Keep the chart simple and focus on what price is actually telling you.

3) Volume confirms the move: Look for volume expansion on breakouts and low volume on pullbacks.

4) Use Anchored VWAP: IPO VWAP, ATH VWAP and Earnings VWAP can show where important groups of buyers are positioned.

5) Relative strength matters: The strongest stocks tend to outperform the market before they become obvious.

6) Respect the major moving averages: The 30-week, 50-day and 200-day tell you a lot about the health of a trend.

Technical Analysis isn't about predicting every move. It's about identifying the trend and putting the probabilities in your favor.

OTHER: GETTING STARTED, TA BASICS & VOLATILITY

My best advice for anyone learning how to pick stocks:

Aug 22, 2026 · 11:24 AM MST · https://x.com/Venu_7_/status/2091230144832897322

30,795 impressions **489** likes **382** bookmarks **40** reposts **23** replies

My best advice for anyone learning how to pick stocks:

You only need:
- Accelerating earnings + sales
- Strong technical structure / Stage 2 uptrend
- A leader in a leading group
- Institutional accumulation
- A new product, market or catalyst

That's it.

Great stocks usually make the story obvious. If you have to squint to find it, there probably isn't one.

Buy strength. Skip the turnaround projects.

OTHER: GETTING STARTED, TA BASICS & VOLATILITY

how do you set a price target when a stock is at all-time highs and there's nothing above?

Aug 13, 2026 · 7:33 AM MST · https://x.com/Venu_7_/status/2087910444249878594 · 🧵 thread

26,829 impressions **299** likes **277** bookmarks **22** reposts **20** replies

how do you set a price target when a stock is at all-time highs and there's nothing above?

classical Technical Analysis solved this 100 years ago.

Wyckoff, Edwards & Magee, Stan Weinstein all used the same tool: measured moves.

the logic: a base = accumulation.

the energy stored inside the base fuels the move out of it. so the move out of the base tends to match the size of the base.

Target = Breakout Level + (Base High - Base Low)

Let's take two live examples in Current Market

$RBRK (weekly):
base high $103, base low $44
base depth: $59

Measured Target = $103 + $59 = $162

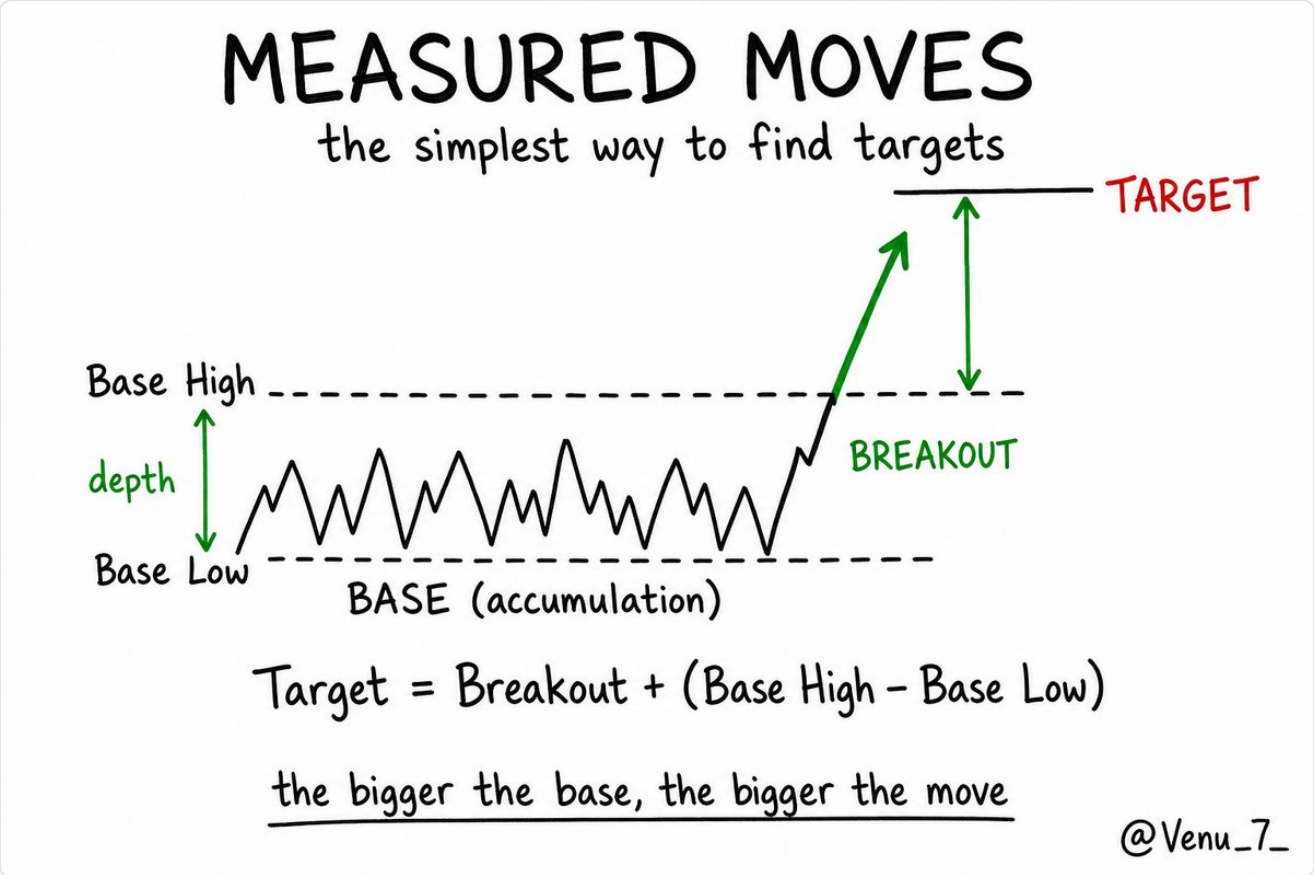

$NBIS (daily):
base high $298, base low $147
base depth:$151

Measured Target = $298 + $151 = $449 Target

two things to remember:
- A measured target is not a ceiling. Strong leaders can go much higher - it’s simply an area where I start watching for profit-taking or consolidation.
- The target only activates after the breakout. While price is still inside the base, it’s just a projected level.

the bigger the base, the higher in space

sharing for educational purposes only, not financial advice.

If anyone wonders why your portfolio feels like it's moving around a lot lately:

Jun 10, 2026 · 8:46 AM MST · https://x.com/Venu_7_/status/2064735902191304779

324,686 impressions **1,038** likes **845** bookmarks **73** reposts **28** replies

If anyone wonders why your portfolio feels like it's moving around a lot lately:

$VIX is sitting at 22.

A quick way to estimate the market's expected daily move is to take the VIX and divide it by 16 (the square root of 252 trading days).

22 ÷ 16 = 1.375%

That means the market is pricing in roughly 1.375% daily moves in **$SPY**. With **$SPY** around $732, that's approximately $10.07 swings per day.

For context, when the VIX was around 14 earlier this year, implied daily moves were only about 0.875%.

In other words, we're experiencing nearly double the day-to-day volatility compared to just a few weeks ago.

So if your portfolio feels more volatile lately, it's not necessarily because you're doing something wrong.

It's the environment.

OTHER: GETTING STARTED, TA BASICS & VOLATILITY

People misunderstand Berkshire's cash pile.

May 10, 2026 · 7:31 AM MST · https://x.com/Venu_7_/status/2053483091155390716

People misunderstand Berkshire's cash pile.

Buffett isn't trying to predict the next 10% move in the market - he's waiting for opportunities that make sense over the next 10-20 years.

Ironically, when Berkshire spends years building cash, those periods have often been some of the best environments for growth investors and strong market leaders.

My best advice for anyone learning Technical Analysis:

Apr 16, 2026 · 7:33 AM MST · https://x.com/Venu_7_/status/2044786292194713768

22,763 impressions **333** likes **388** bookmarks **39** reposts **28** replies

My best advice for anyone learning Technical Analysis:

You only need:
- Candlesticks with volume
- 50, 200-day moving averages for long-term trend
- 9/21 EMA for short-term direction
- Anchored VWAP for real support and resistance

That's it.

When you open a chart, the setup should pop out - not the indicators.

Remove the clutter. Keep it simple. Less is more.

OTHER: GETTING STARTED, TA BASICS & VOLATILITY

one of the most expensive mistake in investing:

Mar 31, 2026 · 8:40 PM MST · https://x.com/Venu_7_/status/2039186061088407708 · 🧵 thread

8,039 impressions **131** likes **9** bookmarks **3** reposts **13** replies

one of the most expensive mistake in investing:

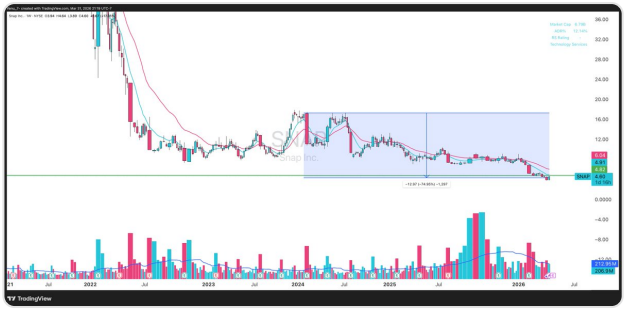

Avoiding a $100 or $200 stock because it "feels high" while loading up on a $5 stock because it "feels cheap."

The market pays you in percentages. Not in low stock prices.

Price is not value. Never was.

If anyone wonders why your portfolio feels like a rollercoaster right now:

Mar 30, 2026 · 7:20 AM MST · https://x.com/Venu_7_/status/2038622304159367522

39,283 impressions **317** likes **207** bookmarks **27** reposts **21** replies

If anyone wonders why your portfolio feels like a rollercoaster right now:

$VIX at 30

Take the VIX and divide by 16 (square root of 252 trading days)

30/16 = 1.875%

That means the market is pricing in 1.875% daily moves on SPY. On a $635 **$SPY**, that's roughly $11.90 swings per day.

For context, when VIX was at 14 earlier this year, implied daily moves were only 0.875%.

More than double the daily volatility now

OTHER: GETTING STARTED, TA BASICS & VOLATILITY

If anyone wonders why we have so much volatility lately:

Mar 13, 2026 · 8:39 AM MST · https://x.com/Venu_7_/status/2032481762522079731 · 🧵 thread

If anyone wonders why we have so much volatility lately:

$VIX at 26.5

Take the VIX and divide by 16 (square root of 252 trading days)

26.5 / 16 = 1.66%

That means the market is pricing in 1.66% daily moves on SPY. On a $666 **$SPY**, that's roughly $11 swings per day.

For context, when VIX was at 14 earlier this year, implied daily moves were only 0.9%.

Nearly double the daily volatility now

if i could go back and give advice to my younger self in my trading/investing journey:

- start early & start small
- learn the basics first - technicals and fundamentals
- don't touch options unless you truly know what you're doing
- never put your entire portfolio into a single stock
- never marry a stock
- be less active in your portfolio and more active in your research
- stop thinking day to day & start thinking in quarters and years what you can achieve
- master your emotions & money becomes a byproduct not the objective

most importantly - be kind and helpful - the world needs more of that

How to build a 3-digit growth portfolio

Oct 28, 2025 · 11:26 AM MST · https://x.com/Venu_7_/status/1983238837322297553

18,920 impressions **218** likes **303** bookmarks **36** reposts **16** replies

How to build a 3-digit growth portfolio

My framework, rules, and process:

1/ Framework – Finding the right setups

- Start with stocks trading above the 50 & 200-day MAs to confirm the uptrend.

- Look for names basing 6–12 months and reclaiming the 200MA on both daily and weekly charts.

- Revenue & EPS growth must be 15%+ YoY fundamentals drive conviction.

- Before pulling daily charts, I always check monthly/weekly to see how the stock behaved in past bull & bear markets.

2/ Rules – Portfolio construction

- Never size more than 15% in a single large cap
- Never size more than 5% in a single small cap
- Top 4–5 holdings are big caps → anchor stability
- Thematic/small caps fill 5–7 positions → rotated for gains
- Portfolio structure: 50% large caps + 30% small caps + 10 to 20% cash

Cash is a position. It lets you strike when real opportunities (like tariff dips) appear.

3/ Process – Watchlist discipline

- Maintain 300+ stocks in a sector-based watchlist.
Track earnings and note which stocks print PEG candles.

- Each morning, scan sectors for strength and narrow to a focus list of 3–5 names per week.

Discipline > quantity.

4/ Mindset – Keep it simple

No chart clutter.Just:

- Candlesticks + volume
- 50/100/200-day MAs for trend
- 9/21 EMA for short-term
- Anchored VWAP for confirmation

Technicals time the entry. Fundamentals tell you whether you're overpaying or underpaying.

5/ Mentality – The hardest part

Big returns don't come from luck - they come from discipline.

Cut losses fast. Let winners run. Rotate when momentum fades.

Stay patient in cash when setups aren't there.
Don't chase every move.

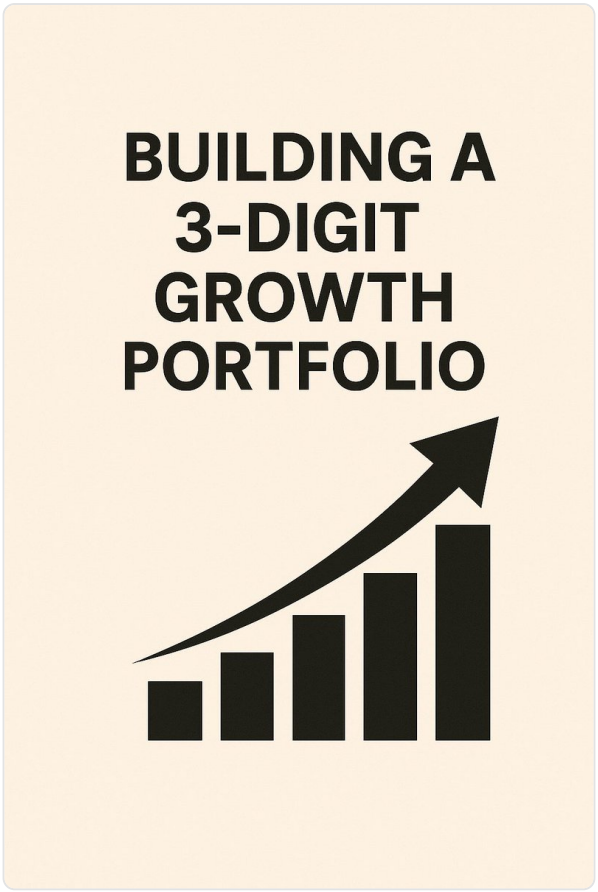

Survive first. Grow next.

6/ Closer

This framework helped me deliver +200% YTD and build a six-figure portfolio.

The process matters more than any single pick.

Hope this helps you build yours. like, comment or share to X algo (and me) Happy!

How to Actually Become a Profitable Investor or Trader

- Master position sizing it's 70% of the game.

- Read "How to Make Money in Stocks" by William O'Neil - timeless lessons on momentum, leadership, and timing.

- Study Stage Analysis by Stan Weinstein know if a stock's in Stage 1 (base), Stage 2 (uptrend), Stage 3 (distribution), or Stage 4 (downtrend).

- Review 50+ charts daily until patterns click instantly.

- Focus on trend, theme, and catalysts that's where multi-baggers are born.

- Buy strength, not weakness. Cheap usually gets cheaper.

- Add on pullbacks within uptrends, never in downtrends.

- Avoid short term options, especially weeklies & 0DTEs - most blow up accounts.

- Find a mentor early learn from experience.

- Blend fundamentals with technicals that's where the real edge lies.

- Always hear out the bear case on your picks - it keeps you objective.

- Stay humble. The market humbles everyone eventually.

Be kind & help others without expecting anything - it always circles back.

6,072 impressions **17** likes **5** bookmarks **0** reposts **2** replies

$UNH

I believe every stock has its own character, and we should try to understand the character of the stocks that we are interested in or that we own. To do that, we need to analyze how our stocks have performed during both bull and bear markets or even during major drawdowns.

Let's take **$UNH** as an example.

UNH IPO'd in 1984 and has experienced four major drawdowns over the past 40 years:

1st Drawdown: 83% (1.5 years) — 1986-87

2nd Drawdown: 60% (4 months)- 1998

3rd Drawdown: 75%(9 months) - 2008

4th Drawdown: 55% so far - 2025

The IPO VWAP acted as support during two of these drawdowns (1998 and 2008). We can ignore the first drawdown since it happened right after the IPO.

If UNH shows further weakness, it should retest the $250 level, possibly undercut to $240, and consolidate there for a few weeks or months to form a base before recovering. In the worst-case scenario, if it fails to hold $250 in the coming days, $200 would likely be the next support.

Now that we've covered technicals, let's look at the fundamentals:

EPS (Earnings Per Share):

2016–2024 CAGR: ~16.4%

2024–2026 Estimated Growth: ~–5.2%
(from 27.66 in 2024 → 26.22 in 2026, slight dip with recovery afterward)

2024–2028 Estimated Growth: ~30.3%
(from 27.66 in 2024 → 36.05 in 2028, strong long-term growth)

Revenue:

2016–2024 CAGR: ~9.8%

2024–2026 Estimated Growth: ~19.6%
(from $400.28B in 2024 → $478.88B in 2026)

2024–2028 Estimated Growth: ~36.3%
(from $400.28B in 2024 → $545.78B in 2028)

Free Cash Flow:

On a trailing twelve-month basis, UNH generated about $25 billion in free cash flow, which is roughly 10% of its total market cap. Free cash flow is a great indicator of how healthy a company's balance sheet is—not just its income statement.

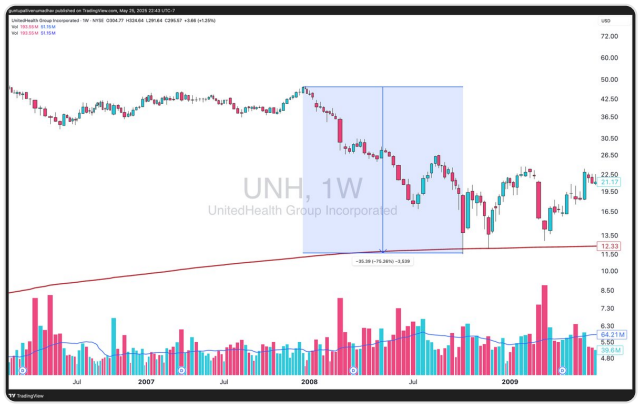

Keep in mind, UNH is the world's 7th largest free cash flow generator in absolute dollars.

So, with all that said, I believe UNH should do okay over a 2- to 3-year holding period—at least in my opinion. This situation reminds me a bit of Boeing about a year ago.

NFA!

My best advice to anyone starting swing trading:

You need only these when it comes to TA:

1/ Candlesticks with volume
2/ 50, 100, 200-day moving averages for long-term perspective, and 9/21 EMA for short-term
3/ Anchored VWAP (AVWAP)

That's it.

When you look at a chart, patterns should pop out instantly — not indicators.

Remove all the unnecessary indicators.

Keep it simple. Less is more.

OTHER: GETTING STARTED, TA BASICS & VOLATILITY

My advice for anyone new to swing trading:

Jan 17, 2025 · 10:53 AM MST · https://x.com/Venu_7_/status/1880312604482236522

1,291 impressions **17** likes **11** bookmarks **0** reposts **3** replies

My advice for anyone new to swing trading:

1. Focus on strong stocks with power earnings gap setups forming bullish patterns like pennants, flags, triangles, or poles.

2. Ensure the stock stays above key moving averages like the 9, 21 EMA, and 50, 100, 200 MA.

3. If you miss a trade, don't chase it. Patience pays.

4. Always set a stop loss—it's your safety net.

5. My go-to setup is a PEG candle with a pullback to the 9 or 21 EMA. This strategy has made me consistently profitable.

6. Remember, cheap stocks often get cheaper, and strong ones keep climbing.

7. Protect your capital first. Making money comes second.

Stay disciplined and stick to your rules!
